Chapter 1

Introduction

The aim of this book is to introduce LaTeX to a non-technical person. LaTeX is excellent for producing professional looking documents, however it is a language not a word processor, so it can take a bit of getting used to, particularly if you have never had any experience using programming languages.

LaTeX does take a while to learn, so why should you use it? Here are a few reasons but it is not an exhaustive list:

LaTeX is far better at typesetting mathematical equations than word processors. I wrote my Ph.D. thesis back in the days of LaTeX2.09 (the old version of LaTeX) and given the high quantity of mathematics that I had to typeset, it would have taken me considerably longer to write it in a word processor, and the resulting document wouldn’t have looked nearly as good. Even Microsoft have acknowledged TeX’s high-quality mathematical typography [12].

Example:
Here’s an equation taken from some kernel survival analysis:

\[
\frac{\partial^2 L}{\partial z_i^2} = -\frac{\partial p_i}{\partial z_i} \left( \frac{e^{v_i}}{1 - e^{v_i}} + v_i \frac{e^{v_i} \frac{\partial v_i}{\partial p_i}}{1 - e^{v_i}} + e^{2v_i} \frac{\partial v_i}{\partial p_i} \right)
\]

(You can find out how to create this equation on page 161 in Section 9.4.9.)

That’s all very well and good if you want to typeset some equations, but if your work doesn’t involve maths, does that mean that LaTeX is not for you? Although I am a mathematician, I have written plenty of documents with no maths in at all, including prose, poetry, newsletters, posters and brochures, but I still opt for LaTeX because using LaTeX ensures consistent formatting, and the style of the document can be completely changed by simply using a different class file, or loading additional packages. This means that I can concentrate on writing the document, rather than worrying about how it will look. It also means that if, after having written a 200 page document, I then find that I need to change all the figure captions so that they are labelled “Fig” instead of “Figure”, all I need to do is edit a single line, rather than going through 200 pages to individually edit every single figure caption.\textsuperscript{1,1}

\textsuperscript{1,1}Sure, you could use a search and replace function, but a sweeping replace-all can have unexpected side effects. For example, your document may include the sentence, “Figures from the last quarter showed improvement”, which would get changed to, “Figs from the last quarter showed improvement”.
Serious fiction writers are taught never to remind the reader that they’re reading a book. Poor formatting is just as much a reminder of this as authorial intrusion.

\LaTeX makes it very easy to cross-reference chapters, sections, equations, figures, tables etc, and it also makes it very easy to generate a table of contents, list of figures, list of tables, index, glossary and bibliography. You don’t need to worry about numbering anything, as this is done automatically, which means that you can insert new sections or swap sections around without having to worry about updating all the section numbering etc. Furthermore, if you use Bib\TeX in combination with \LaTeX, and you have, say, 100 or more citations, it doesn’t matter if you are then told that the citations have to be re-ordered (say, in order of citation rather than alphabetically). All that is required is a minor edit to change the appropriate style file rather than ploughing through the entire document changing all the citations by hand.

When you are editing a document using a word processor, the word processor has to work out how to reformat the document every time you type something. If you have a large document with a great many inserted objects (such as figures and equations), the response to keyboard input can become very slow. You may find that after typing a few words you will have to wait until the computer catches up before you can see what you have typed. With \LaTeX you type in your code using an ordinary text editor. The document doesn’t get formatted until you pass it to \LaTeX, which means that you are not slowed down by constant reformatting.

Lastly, there’s the fact that \LaTeX follows certain typographical rules, so you can leave most of the typesetting to \LaTeX. You rarely need to worry about minor things such as inter-sentence spacing. The default is English spacing, but if you have a publisher who disapproves of this, you can switch it off with a single command. (See Section 2.13.)

\LaTeX will also automatically deal with f-ligatures. That is, if any of the following combination of letters are found: fl, ffl, ff, fi, ffi, they will automatically be converted into the corresponding ligatures: fl, ffl, ff, fi, ffi. Note the difference between fluffier (2 ligatures) and fluffier (no ligatures).

These points may seem minor but they all contribute towards the impact of the entire document. When writing technical documents, the presentation as well as the content is important. All too often examiners or referees are put off reading a document because it is badly formatted. This provokes an immediate negative reaction and provides little desire to look favourably upon your work.

To give you an idea of what you can do with \LaTeX, this book was written in \LaTeX. The PDF versions (including the paperback version) were generated using PDF\LaTeX and makeindex and the HTML version was generated.

\footnote{1,2Glossaries are covered in \textit{Using \LaTeX to Write a PhD Thesis} \cite{13}.}
\footnote{1,3Automating bibliographies is covered in \textit{Using \LaTeX to Write a PhD Thesis} \cite{13}.}
\footnote{1,4Ligatures can be suppressed using the microtype package if necessary}
\footnote{1,5The source code is available at \url{http://www.dickimaw-books.com/latex/novices/}, but it really is not the place to start if you are a beginner, as it contains \LaTeX and \texttt{Perl} code beyond the scope of this tutorial.}
using the \texttt{\LaTeX 2HTML}\footnote{\url{http://www.latex2html.org/}} converter.

For more reasons as to why you might want to use \LaTeX instead of a word processor, have a look at \textit{Why \TeX}?

\section{Class and Package Documentation}

There are hundreds of classes and packages available on the Comprehensive \TeX\ Archive Network\footnote{\url{http://mirror.ctan.org/}} (CTAN). These are made available by many volunteers. Some provide detailed documentation to accompany their contribution, while others only provide a few notes in a README file or comments in the source files. This book only provides an introductory look at a small selection of these contributions. If you want further details on how to use a particular class or package you should check the documentation that accompanies it. You can use the \texttt{texdoc} application to search for the documentation. This is a command line application, which means you need a terminal or command prompt (see Section 2.5).

To use \texttt{texdoc}, you need to type (at the command prompt) \texttt{texdoc} followed by a space followed by the name of the class or package you want information about. For example, to read the \texttt{memoir} documentation, type the following at the command prompt (press the return/enter key at the end of the line):

\begin{verbatim}
texdoc memoir
\end{verbatim}

Some packages come with more than one set of documentation. For example, the \texttt{glossaries} package comes with the main user manual, a short guide for beginners and the documented code for advanced users. Just doing

\begin{verbatim}
texdoc glossaries
\end{verbatim}

will display the advanced documented code. To list all available documentation for a package, use the -l option:

\begin{verbatim}
texdoc -l glossaries
\end{verbatim}

Then type the number corresponding to the file you want to view. If you can remember the file name (for example \texttt{glossaries-user}) you can type that next time you want to view it:

\begin{verbatim}
texdoc glossaries-user
\end{verbatim}

There is also a Perl/Tk-based graphical user interface (GUI) called \texttt{texdoctk}, which is distributed with \TeX\ Live, that you can use instead of \texttt{texdoc} if you can't work out how to use a \texttt{terminal} or prefer a GUI approach.

Failing that, you can also check on CTAN\footnote{\url{http://mirror.ctan.org/}} using the URL \url{ctan.org/pkg/⟨name⟩}, where \texttt{⟨name⟩} is the name of the package or class. For example, if you want to look up the documentation for the \texttt{memoir} package, you can
find it at http://ctan.org/pkg/memoir or go to http://mirror.ctan.org/ and search for the package or class.

Another alternative recently made available is to use the URL texdoc.net/pkg/⟨name⟩. For example, http://texdoc.net/pkg/memoir will fetch the documentation for the memoir class.

However, it’s better to use texdoc or texdoctk to read the documentation installed with the class or package on your computer to ensure it matches the installed class or package version.

Note that it is important to remember that the TeX world is mostly supported by volunteers. CTAN [1] itself is maintained by a very small group (currently two people). It’s not like a commercial company with 24/7 support and hundreds of paid employees constantly updating the software. At its core, TeX is a community effort. While some volunteers actively maintain and update their classes or packages, some people move on to other things and stop maintaining their work. Occasionally, if the class or package is popular, someone else might take over maintenance. There is no dedicated helpdesk to go to, but there are many ways of getting help, see Appendix C (Need More Help?)

1.2 Overview

This document is structured as follows:

Chapter 2 (Some Definitions) defines terms that will be used throughout this document. I strongly suggest that you look through this chapter before you start so that you understand the terminology used in this document. At the very least, you should read the first part that details how corresponding input and output is displayed in this document — you need to understand the difference between “input” (source code) and “output” (how the source code will appear in the typeset document).

Chapter 3 (From Source Code to Typeset Output) details the software that you will need to use \LaTeX{} and describes how to use the software.

Chapter 4 (Creating a Simple Document) shows you how to create a very basic document.

Chapter 5 (Structuring Your Document) shows you how to create chapters and other sectional units so that you end up with a fully structured document.

Chapter 6 (The graphicx Package) shows you how to include external image files and how to scale and rotate text.

Chapter 7 (Floats) describes how to create figures and tables.

Chapter 8 (Defining Commands) describes how to define your own commands, and redefine existing commands.

Chapter 9 (Mathematics) describes how to typeset mathematics.
Chapter 10 (Defining Environments) describes how to define new environments.

Chapter 11 (Counters) discusses how numbers are stored in counters, how to change their values, and how to define your own counter.

Appendix A (Downloading and Installing Packages) shows you how to download and install additional packages that weren’t installed with your \TeX{} distribution.

Appendix B (Common Errors) documents possible errors you may encounter, and gives advice on how to fix them.

Appendix C (Need More Help?) gives pointers on where to go for help.

Throughout this document there are pointers to related topics in the UK List of \TeX{} Frequently Asked Questions\(^{1,8}\) (UK FAQ). These are displayed in the margin in square brackets, as illustrated on the right. You may find these resources useful in answering related questions that are not covered in this book.

This book and associated files, including solutions to the exercises, are available on-line at: http://www.dickimaw-books.com/latex/novices/. The links in this document are colour-coded: internal links are blue, external links are magenta.

1.3 Recommended Reading

This document is designed as an introductory text, not a comprehensive guide. For further reading try some of the following:

\TeX{}: A Document Preparation System \([9]\) is the user guide and reference manual for \TeX{}, and is a good basic text for anyone starting out, however it doesn’t cover AMSTeX, so anyone who needs to typeset more than basic mathematics may prefer either A Guide to \TeX{} \([7]\) or The \TeX{} Companion \([3]\). Both these books cover AMSTeX, BibTeX and makeindex.

In the same series as The \TeX{} Companion, there is also The \TeX{} Graphics Companion \([5]\) which details how to illustrate documents with \TeX{} and PostScript, including a chapter on colour (coloured text, background, tables and slides). This is recommended to anyone who is contemplating heavy use of graphics, but you do need a basic knowledge of \TeX{} before delving into it.

The final book in the “Companion” series which you may find useful is The \TeX{} Web Companion \([4]\). This is recommended for those interested in creating documents for the web, either as HTML or PDF. It details how to convert \TeX{} documents into HTML using various applications such as \LaTeX{}2HTML and TeX4ht, and how to create PDF documents using PDF\TeX{}, including how to create active links within your document using the hyperref package.

There are two new \TeX{} books that I haven’t read but have been recommended to me: \TeX{} Beginner’s Guide \([8]\) and \TeX{} and Friends \([19]\).

\(^{1,8}\)http://www.tex.ac.uk/faq
Note that the UK \TeX\ User Group\footnote{http://uk.tug.org/} (UK TUG) has a 25\% book discount scheme for members. See http://uk.tug.org/membership for more details of that and other associated benefits. If you're not in the UK, have a look at http://www.tug.org/usergroups.html to see if there is a local user group in your area.

There is also a wealth of \TeX\-related information on the Internet. \footnote{FAQ: How to get help} CTAN \footnote{1} is a good place to start. You can check the on-line catalogue \footnote{21} for information about available software and, as mentioned earlier, there is also the list of frequently asked questions which I recommend you try if you have any queries. See also Appendix C (Need More Help?)
Chapter 2
Some Definitions

As mentioned in Chapter 1 (Introduction), \LaTeX{} is a language, so you can’t simply start typing and expect to see your document appear before your very eyes. You need to know a few things before you can get started, so it’s best to define a few terms first. Don’t worry if there seems a lot to take in, there will be some practical examples later, which should hopefully make things a little clearer.

Throughout this book, source code is illustrated in a typewriter font with the word \texttt{Input} placed in the margin, and the corresponding output (how it will appear in the PDF document) is typeset with the word \texttt{Output} in the margin.

**Example:**
A single line of code is displayed like this:

This is an \texttt{\textbf{example}}.

The corresponding \texttt{output} is illustrated like this:

This is an \texttt{example}.

Segments of code that are longer than one line are bounded above and below, illustrated as follows:

\begin{verbatim}
Line one\par
Line two\par
Line three.
\end{verbatim}

with corresponding output:

\begin{verbatim}
Line one
Line two
Line three.
\end{verbatim}

Take care not to confuse a backslash \ with a forward slash / as they have different meanings. (Commands typeset in blue, such as \texttt{\par}, indicate a hyperlink to the command definition in the \texttt{summary}.)

**Command** definitions are shown in a typewriter font in the form:

\begin{verbatim}
\documentclass[⟨options⟩]{⟨class file⟩}
\end{verbatim}

In this case the command being defined is called \texttt{\documentclass} and text typed \texttt{(like this)} (such as \texttt{⟨options⟩} and \texttt{⟨class file⟩}) indicates the type of thing
you need to substitute. (Don’t type the angle brackets!) For example, if you want the \texttt{class file} you would substitute \texttt{⟨class file⟩} with \texttt{scrartcl} and if you want the \texttt{letterpaper} option you would substitute \texttt{⟨options⟩} with \texttt{letterpaper}, like this:

\documentclass[letterpaper]{scrartcl}

But more on that later.

Sometimes it can be easy to miss a space character when you’re reading this kind of book. When it’s important to indicate a space, the visible space symbol \texttt{␣} is used. For example:

A sentence consisting of six words.

When you type up the code, replace any occurrence of \texttt{␣} with a space.

One other thing to mention is the comment character \texttt{%} (the percent symbol). Anything from the percent symbol up to, and including, the end of line character is ignored by \LaTeX. Thus

A simple \% next comes a command to make some bold text

\texttt{\textbf{example}}

will produce the output

A simple \texttt{example}

The percent symbol is often used to suppress unwanted space resulting from line breaks\textsuperscript{2.1} in the \texttt{source code}. For example, the following code

Foo\%

Bar

will produce the output:

FooBar

as opposed to

Foo

Bar

which will produce the output:

Foo Bar

On the other hand, spaces at the start of a line of input are ignored, so

Foo\%

Bar

still produces:

FooBar

\textsuperscript{2.1}\LaTeX treats the end-of-line character as a space.
2.1 Source Code

The source code consists of all the text and \LaTeX\ commands that make up an entire document. The source code is typed in using a text editor, and saved with the file extension .tex. The source code may be contained in just one file, or it might be split across several files.

2.2 Output File

The \LaTeX\ application reads in your source code and creates the typeset document, the output file. This book assumes that you will be using the version of \LaTeX\ that produces PDF files (PDF\LaTeX). If you are using TeXWorks (see Chapter 3 (From Source Code to Typeset Output)), you need to select the “PDF\LaTeX” item from the drop-down list. If you are using TeXnicCenter, select the “\LaTeX\ ⇒ PDF” build profile. If you are using WinEdt, when you want to build your document click on the button marked “PDF\LaTeX” rather than the one marked “\LaTeX\”. If you are using a terminal or command prompt, use the command pdflatex rather than latex. (TeXnicCenter, WinEdt and using the terminal or command prompt approach are described in the supplemental material.)

2.3 DVI File

\TeX\ (and subsequently \LaTeX) originally created DVI (DeVice Independent) files instead of PDF files. However, although there are free DVI viewers, not many people have them installed, so it’s really only \TeX\ users who can read them. Also, you can’t embed image files in a DVI file or have fancy effects, such as rotation. Instead, people can use \TeX/\LaTeX\ to create a DVI file and then use an application to convert the DVI file to PostScript.

These days PDF is the preferred platform-independent format, and with the advent of PDF\TeX, modern \TeX/\LaTeX\ users can directly create PDF documents rather than going through the DVI route. Some people still prefer to create DVI files as an intermediate step, particularly if they want to embed PostScript instructions (as is done by the pstricks package). For simplicity, this book assumes that you have a modern \TeX\ distribution and are using PDF\LaTeX\ rather than \LaTeX\ ⇒ DVI.

2.4 Auxiliary Files

When \LaTeX\ creates your output file, it not only creates a PDF file but also creates other associated files. The most common of these are the log file, which has the extension .log, and the auxiliary file, which has the extension .aux.

\[\text{There was no PDF back then.}\]
The log file contains a transcript of the most recent \texttt{\LaTeX} run. It lists all the files that have been loaded, including the \texttt{class} file and any \texttt{packages} that your document has used. There should also be the class or package version number and date, although this is dependent on the class or package author. If you ever want to ask for help, you need to say what version you are using.

For example, this book uses the \texttt{scrbook} class, so the log file includes the lines:

\begin{verbatim}
(/usr/local/texlive/2010/texmf-dist/tex/latex/koma-script/scrbook.cls
Document Class: scrbook 2010/06/17 v3.06 KOMA-Script document class (book)

(This is actually now out-of-date as the latest version at the time of writing this is version 3.11a dated 2012/07/05.)
\end{verbatim}

Error messages, warnings and general information messages are also written to the log file as well as the document statistics. You can delete this log file if you like. It will be created again the next time you run \texttt{\LaTeX}.

The auxiliary file contains all the information needed for cross-referencing (covered in Section 5.5). This is needed to ensure all your cross-references are up-to-date. You can delete this file, but you will need at least two \texttt{\LaTeX} runs to ensure your cross-references are correct the next time you create your output file.

\texttt{TeXWorks} also creates a file with the extension \texttt{.synctex.gz}. This file allows you to jump to and from the source code and the appropriate part of the output file. If you delete this file, you will have to run \texttt{\LaTeX} again before you can use this function.

Other files that may be created include the table of contents file (\texttt{.toc}), the list of figures file (\texttt{.lof}) and the list of tables file (\texttt{.lot}). Some \texttt{class files} or \texttt{packages} create additional files. If your operating system hides file extensions, you might want to switch off this behaviour, if possible, to make it easier to distinguish between all the various files.

\texttt{TeXWorks} has a menu item File→Remove AUX Files that will remove the auxiliary files.

\section{2.5 Terminal or Command Prompt}

Sometimes you may find that you need to use a command-line application. This is an application that doesn’t have a graphical user interface. This isn’t specific to \texttt{\TeX}, but the \texttt{\TeX} distribution comes with a number of them. In fact, front-ends (such as \texttt{TeXWorks}) run some of these applications for you when click on the typeset or build button.

Most operating systems provide a terminal or command prompt where you can type the command-line application name and any associated information. For example, Figure 2.1 shows a terminal running under Fedora on Linux.
Windows To open the MSDOS Prompt, go to the Start menu, then “All Programs”, then “Accessories” and click on “MSDOS Prompt”.

Mac OSX To open the Mac Terminal, go to your “Applications” folder, open “Utilities” and double click on “Terminal”.

Unix etc The Terminal is usually located either in the “Applications” menu or in the “System Tools” subdirectory of the “Applications” menu.

Example:
One such command-line application you are likely to need is texdoc. This is mentioned in more detail in Section 1.1, but to use texdoc you need to open the terminal or command prompt as described above and type texdoc followed by a package or class name, for example:

texdoc scrbook

(see Figure 2.2) then press the Enter or Return key.

Other \TeX-related command-line applications include pdflatex, bibtex, makeindex, xindy and kpsewhich.

2.6 Commands

A command is used to tell \TeX to do a particular thing at that point in the document. These are the basic forms a command can take:
1. **A Control Word.**

This is a backslash `\` followed by letters \(A, \ldots, Z, a, \ldots, z\). There can be no non-alphabetical characters in the command, apart from the initial backslash, and the name is always **case-sensitive** so, for example, `\gamma` and `\Gamma` have different meanings. One command that often trips up new users is `\LaTeX`, which prints the LaTeX logo: \(\LaTeX\). This command has three capital letters and two lower case letters. If you get the case of any of the letters incorrect, you will get an “undefined control sequence” error.

There must be no space between the backslash and the start of the command name. Some command names are made up of two or more names joined together, such as `\tableofcontents`. *Make sure you don’t insert any spaces in the control word.* This will either lead to an error or an unexpected result. For example,

\begin{itemize}
  \item `\appendixname`\[\checkmark\]
  \item `\appendix name`\[\times\]
\end{itemize}

Most \(\LaTeX\) commands have fairly self-explanatory names. (For example, `\chapter` starts a new chapter and `\rightarrow` prints an arrow.)
pointing to the right.) However, in most cases, you need to use U.S. spelling (for example, `\color` rather than `\colour`).

This is the most common form of command. Any spaces immediately following a command of this type are ignored, so for example

\TeX\ nician

will produce

\TeX\nician

whereas

\TeX\{}\ nician

will produce

\TeX\ nician

But the following will cause an “undefined control sequence” error:

\TeX\nician

There is one command that you must use in every document you create, and that is the `\documentclass` command. This command must be placed at the very start of your document, and indicates what type of document you are creating. This command is described in more detail in Chapter 4 (Creating a Simple Document).

2. A Starred Command

Some commands have variants that are indicated by an asterisk at the end of the name. For example, `\chapter` makes a numbered chapter whereas `\chapter*` is makes an unnumbered chapter. A starred command is the version of the command with the asterisk. (On a UK keyboard the asterisk character is usually located on the same key as the digit 8.)

This may seem like a different form to a control word, described above. After all, I’ve just said that a control word can only contain alphabetical characters. However a starred command is actually a control word (such as `\chapter`) followed by an asterisk. The control word checks to see if the next character is an asterisk. If it is, it performs one action, otherwise it performs another action.

This type should therefore just come under the previous category, but as you will often hear of “starred commands” it seemed better to have a separate category.

3. A Control Symbol.

This is a backslash followed by a single non-alphabetical character. For example `\%` will print a percent symbol. Spaces are not ignored after this type of command, for example
17.5\% VAT

will produce

17.5\% VAT

It's also possible to have starred forms of control symbols. For example \\ forces a line break. If it's not followed by an asterisk a page break is allowed at that line break, but if it is followed by an asterisk \\* no page break is allowed at that line break. (If a page break is needed, it will be made at the end of the previous line instead.)

4. **Character Sequence.**

Some special sequences of characters combine to form an instruction. For example ffi is the command to produce the ffi ligature, and the sequence of symbols !' is the command to produce the upside down exclamation mark ¡

5. **An Internal Command.**

This is like the first type, a control word, but the @ character appears in the command name (for example \c@section) however internal commands should only be used in class files or packages. The @ symbol takes on a special meaning when a file is included using \documentclass (a class file) or \usepackage (a package).

For example, in a class file or package \c@section is an internal representation of the section counter, whereas in a .tex file \c@section is interpreted as the command \c (the cedilla accent command) that takes the character @ as its argument, followed by section, which produces the rather odd looking @section.

Don't be tempted to use internal commands until you have first grasped the basics. You have been warned!

### 2.7 Grouping (or Scope)

A segment of code may be grouped by placing it within { and } (curly braces). Most commands that occur within a group will be local to that group. For example, \bfseries changes the font weight to bold, so the following segment of code:

```
Here is some text. {This text \bfseries is in a group.} Here is some more text.
```

will appear in the typeset document looking like:

Here is some text. **This text is in a group**. Here is some more text.

As can be seen, the font change only stays in effect until it reaches the end of the group (signified by the closing curly brace }). For a command to
be in the same scope as another command, both commands must be within the same group. For example, in the following, \bfseries and \itshape are in the same scope:

\{\bfseries Some bold \itshape and italic text\}

But below, they are in different scopes:

\{\bfseries Some bold text\} {\itshape and some italic text}

Environments form an implicit scope.

2.8 Arguments (also called “Parameters”)

Some commands take one or more arguments. This provides a way to give L\LaTeX\ additional information so that it is able to carry out the command. There are two types of arguments: mandatory and optional.

2.8.1 Mandatory Arguments

Mandatory (or compulsory) arguments are arguments that have to be specified.

Examples:
1. If you want a footnote, you need to use the \footnote command, which has a mandatory argument that specifies the contents of the footnote. Like this:

Here is a footnote.\footnote{This is the footnote text.}

Here is a footnote.\footnote{This is the footnote text.}

(By default you won’t get a hyperlink. This book uses the hyperref package, which generates the hyperlinks.)

2. If you want to start a new chapter, you need to use the \chapter command, but you also need to tell \LaTeX\ the title of this new chapter. So the \chapter command takes one mandatory argument that specifies the title.

For example, the following code:

\chapter{Some Definitions}

was used to generate the heading for the current chapter (at the top of page 7).

3. The command \textbf typesets its argument in a bold font (as opposed to the declaration \bfseries which switches to a bold font.)

For example, the following code:
\textbf{Some bold text.}

produces the output

\textbf{Some bold text.}

\textbf{Notes:}
1. \LaTeX{} takes the first non-space object following the command name as the argument, which is why in the above examples the arguments have to be grouped.

Suppose the last example above didn't have a group, so instead the code was:

\textbf{Some bold text.}

then only the “S” would be the argument because it’s the first object following the command, in which case the output would look like:

Some bold text.

2. If you want the argument to be blank, use empty braces: \{\}. For example, suppose you want to have a chapter without a title\footnote{This is the footnote text.} you would need to do:

\chapter{ }

\textbf{2.8.2 Optional Arguments}

Some \textbf{commands} may have one or more \textit{optional arguments}. Unlike \textbf{mandatory arguments}, optional arguments must always be enclosed in square brackets \[\].

\textbf{Example:}

The command \textbackslash\textbackslash{} ends a line. So the following segment of code:

\texttt{Line one\textbackslash \textbackslash Line two.}

will produce the following output:

\begin{verbatim}
Line one
Line two.
\end{verbatim}

However the \textbackslash\textbackslash{} command also has an optional argument that allows you to specify how big the gap between the two lines should be. So the following segment of code:

\texttt{Line one\textbackslash [1cm] Line two.}

will produce the following output:

\begin{verbatim}
Line one
Line two.
\end{verbatim}

\footnote{The numbers for chapters, sections etc are automatically inserted by \LaTeX{}, so this example would produce a numbered chapter without a title.}
Incidentally, note the difference between the previous example, and the following example:

Line one\{(1cm)} Line two.

In this example the \[1cm\] has been placed inside a group, so it is no longer considered to be an optional argument, and since the command \ does not take a mandatory argument, the \[1cm\] is simply interpreted as ordinary text.

**EXAMPLE:**
The command \framebox (which will be covered later in Section 4.7.1) takes a mandatory argument and two optional arguments. \framebox puts a frame around the contents of its mandatory argument:

\framebox{Some Text}

The first optional argument can be used to make the box a specified width:

\framebox[4cm]{Some Text}

The second optional argument specifies the justification of the text (left, right or centred) within the box:

\framebox[4cm][r]{Some Text}

In general, if a command has both optional and mandatory arguments, the optional arguments are usually specified first (although there are a few exceptions).

### 2.9 Moving Arguments and Fragile Commands

Certain types of commands, called *fragile commands*, can seriously mess things up when they are used in what is termed a moving argument. These types of argument are generally those whose contents are copied to another part of the document. For example, section headings appear at the start of a section, but they can also appear in the table of contents. The \footnote command is a fragile command, so
\section{A heading\footnote{with a footnote}}

will cause an error.

If there is no other command to use in its place, you should use \protect immediately before the fragile command:

\section{A heading\protect\footnote{with a footnote}}

This, however, is a contrived example, because it isn’t a good idea to have a footnote in a section heading, as it will also end up in the table of contents, and possibly in page headings.

\section{2.10 Robust Commands}

A robust command is a command that is not a fragile command.

\section{2.11 Short and Long Commands}

A short command is a command whose argument may not contain a paragraph break (either as a blank line or using \par). Conversely, a long command is a command whose argument may contain a paragraph break.

Using short commands helps to test for forgotten braces, so it is recommended that when you define a new command (see Chapter 8 (Defining Commands)) you should always make the command a short command, unless there is a chance that the argument may need to contain a paragraph break.

\section{2.12 Declarations}

The term declaration is used to refer to a command that affects the document from that point onwards. The declaration itself does not produce any text and, in most cases, its effect can be localised by placing the declaration within a group. For example, \texttt{\bfseries} is a declaration that switches the current font weight to bold, so the following code

\begin{verbatim}
Here is some normal text.
\bfseries Here is some bold text.
\end{verbatim}

will appear in the typeset document looking like:

Here is some normal text. \textbf{Here is some bold text.}

Some declarations don’t immediately have a visible effect. For example, the declarations

\texttt{\raggedright \raggedleft \centering}
only set the paragraph justification to ragged-right, ragged-left or centred, respectively, if the declaration is still in effect at the end of the paragraph. That is, if it is still in effect at the next \par or blank line.

**EXAMPLE:**

```latex
This is an example paragraph illustrating the paragraph justification declarations. The default justification is fully justified. \raggedright The paragraph justification can be switched to ragged-right or \raggedleft ragged-left. \par
```

Above, the justification at the paragraph break is ragged-left, so that’s the justification used for the entire paragraph. Compare with:

```latex
{This is an example paragraph illustrating the paragraph justification declarations. The default justification is fully justified. \raggedright The paragraph justification can be switched to ragged-right or \raggedleft ragged-left.} \par
```

Above, the justification at the paragraph break is fully-justified, since both the declarations \raggedright and \raggedleft are cancelled when their local scope (signified by the curly braces) ends. This type of mistake most often occurs when people try to centre text doing something like:

```latex
{\centering Some text that is supposed to be centred.}
```

While we’re on the subject of centred text, don’t be tempted to use \centerline. It’s obsolete [15].
2.13 Inter-Sentence Spacing

Inter-sentence spacing refers to the default type of space to be inserted between adjacent sentences within a paragraph. There is disagreement over what size this space should be. French spacing uses the same space as used between words. English spacing uses an en-space (half an em-space). With proportional fonts (such as this one), the en-space is slightly larger than a single space. The difference is shown here:

(Note that with fully-justified paragraphs, in both cases the spaces may be stretched to ensure the sides of the paragraph are flushed.)

\texttt{\LaTeX} (and TEX) defaults to English spacing, but you can switch to French spacing using the declaration:

\verbatim\frenchspacing

and switch back again using

\verbatim\nonfrenchspacing

There was no en-space on a typewriter, so typists started using two spaces in an attempt to emulate that slightly larger than one space look. This habit has spread to word-processor users as well, and now many people incorrectly assume English spacing means adding two spaces after a full stop, which is too wide and looks ugly, but this error shouldn’t be used as a criticism against English spacing.

There has been a gradual trend towards French spacing over the last century, and some publishers insist on it. I think this may in part be due to a backlash against the ugliness of two spaces in typewritten and word-processed documents. In fact the Oxford Style Manual [11] simply states, “In text, only use a single space after all sentence punctuation.”

Personally, I prefer English spacing, particularly in reference books. I have many reference books on my shelf, but I haven’t read any of them from cover-to-cover. I flick to a particular section and skim through the paragraphs until I reach the desired bit of information. Sometimes I’ve already looked something up, so I have a vague idea as to where to find the information. The extra space between sentences makes it easier to locate a particular sentence.

This isn’t so much of an issue with books designed to be read from beginning to end, such as a novel. However, I have read one such book
that used a font where the commas had tiny tails and most of the sentences contained multiple proper nouns, which made it very difficult to read as it wasn’t clear where the sentences ended. Is that a full stop followed by a new sentence that happens to start with a proper noun, or is it a comma whose tiny tail is blurred by my short-sighted eyes followed by a clause that happens to start with a proper noun? A well-written, well-presented document should not interrupt the reader, forcing them to continually go back to re-parse a sentence.

However, if you are writing a document, whether prose or technical, with the intention of having it published you must check with the publisher’s guidelines to see if they insist on a particular style.

**NOTES:**
An end of sentence punctuation mark can be one of: a full stop (.), exclamation mark (!) or question mark (?).

1. If an end of sentence punctuation mark follows a lower case character, \TeX{} assumes the punctuation mark indicates the end of the sentence. For example, as in:

   Did you see that? I certainly did.

2. Where this isn’t the case, use \textbackslash (backslash followed by a space).

   This can happen when a sentence contains a lower case abbreviation, e.g.\textbackslash like this one.

3. If an end of sentence punctuation mark follows an upper case character, \TeX{} assumes the sentence hasn’t ended at that point. For example, as in:

   The G.P. said it was only hypochondria.

4. Where the sentence actually ends with an upper case letter, add \textbackslash@ after the letter and before the punctuation mark.

   Yesterday, I saw my G.P\textbackslash@. Tomorrow I’m going to see the specialist.

**Note on Typewriter Fonts**
Note that \texttt{nonfrenchspacing} in a monospaced font will insert two spaces between sentences, emulating a typewritten document.
\ttfamily
\nonfrenchspacing x. x.

\frenchspacing x. x.

x. x.

x. x.

2.14 Hyphenation

Words sometimes require *hyphenation* to help justify paragraphs and prevent overly large areas of white space or protrusions into the right margin. Some word processors by default don’t hyphenate words in fully-justified paragraphs, which has led some people to believe that hyphenation is bad. Just because word processors do something a certain way, doesn’t mean that it’s the correct way. \TeX{} has an excellent hyphenation algorithm, but the default hyphenation pattern is designed for English. If you are writing in another language, use the babel package to switch the hyphenation pattern (see Section 5.8).

Despite using an excellent algorithm, \TeX{} occasionally gets the hyphenation wrong, particularly where the hyphenation is context sensitive. There are two ways of setting the hyphenation for a given word.

1. For all occurrences of the word, use

\begin{verbatim}
\hyphenation{(hyphenated word)}
\end{verbatim}

inserting a hyphen - at all possible hyphenation points. For example:

\begin{verbatim}
\hyphenation{gal-axy}
\end{verbatim}

2. For a particular instance of a word, use \- at the hyphenation point within the word. For example:

\begin{verbatim}
There once was a little alien called Uiop who lived in the faraway gal\-axy of Zxcv.
\end{verbatim}
2.15 Environments

An *environment* is a block of code contained within the commands

\begin{⟨env-name⟩}

and

\end{⟨env-name⟩}

where ⟨env-name⟩ is the name of the environment. The block of code is then formatted in a method specific to that environment. For example, the `bfseries` environment will typeset the contents of the environment in a bold font. The following code:

\begin{bfseries}Here is some bold text.\end{bfseries}

will appear in the typeset document looking like:

Here is some bold text.

Some environments also supply commands that may only be used within that environment.

**EXAMPLE:**
The `itemize` environment provides a command called `\item` so that you can specify individual items within an unordered list:

```
\begin{itemize}
\item Cabbages
\item Bananas
\item Apples
\end{itemize}
```

The above will produce the following output:

- Shopping List:

```
• Cabbages
• Bananas
• Apples
```

\[^{28}\text{Note there is no backslash in the environment name.}\]
2.16 The Preamble

The preamble is the part of the source code that comes after the \documentclass command and before \begin{document} (the start of the document environment). Only a few special commands may be placed in the preamble (such as \title), and there are a few special commands that may only go in the preamble (such as \usepackage). Nothing that generates text (for example, \maketitle) may go in the preamble.

\begin{verbatim}
\documentclass{...}
\end{verbatim}← This bit in here is the preamble.
\begin{verbatim}
\begin{document}
\end{verbatim}

2.17 Lengths

A length register stores dimensions (such as 1in, 5cm, 8.25mm). Like control words, length registers start with a backslash and only contain alphabetical characters in their name. These registers are used to determine page layouts etc. For example, the paragraph indentation is given by the length register \parindent. Acceptable units of measurement are listed in Table 2.1. The two relative units “em” and “ex” are dependent on the current font. (The em-value used to be the width of an “M” and the ex-value was the height of the letter “x”, but these days the values are more arbitrary [6].) Use em for widths and ex for heights if you want to use relative values.

Table 2.1 Units of Measurement

<table>
<thead>
<tr>
<th>Unit</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>pt</td>
<td>$72.27\text{pt} = 1\text{in}$</td>
</tr>
<tr>
<td>in</td>
<td>$1\text{in} = 25.4\text{mm}$</td>
</tr>
<tr>
<td>mm</td>
<td>$1\text{mm} = 2.845\text{pt}$</td>
</tr>
<tr>
<td>cm</td>
<td>$1\text{cm} = 10\text{mm}$</td>
</tr>
<tr>
<td>ex</td>
<td>“x-height” of the current font</td>
</tr>
<tr>
<td>em</td>
<td>width of a “quad” in the current font</td>
</tr>
<tr>
<td>sp</td>
<td>scaled point: $1\text{sp} = 65536\text{pt}$</td>
</tr>
<tr>
<td>bp</td>
<td>big point (or PostScript point): $72\text{bp} = 1\text{in}$</td>
</tr>
<tr>
<td>dd</td>
<td>didot point: $1\text{dd} = 0.376\text{mm}$</td>
</tr>
<tr>
<td>pc</td>
<td>pica: $1\text{pc} = 12\text{pt}$</td>
</tr>
<tr>
<td>cc</td>
<td>cicero: $1\text{cc} = 12\text{dd}$</td>
</tr>
<tr>
<td>mu</td>
<td>math unit: $18\text{mu} = 1\text{em}$</td>
</tr>
</tbody>
</table>

To change a length you can use the command:

\begin{verbatim}
\setlength{⟨cmd⟩}{⟨length⟩}
\end{verbatim}

where ⟨cmd⟩ is the register (for example, \parindent) and ⟨length⟩ is the new length. Alternatively, you can add a value to a length using:

\begin{verbatim}
\addtolength{⟨cmd⟩}{⟨length increment⟩}
\end{verbatim}

The value of a length register can be displayed in your document using
A rubber length is a length that has a certain amount of elasticity. This enables you to specify your desired length but allows \TeX to stretch or contract the space to get the body of text as flushed with the margins as possible.

For example, the paragraph gap \verb|\parskip| is usually set to 0pt plus 1pt. This means that the preferred gap is 0pt but \TeX can stretch it up to 1pt to help prevent the page from having a ragged bottom. For example:

\begin{verbatim}
\setlength{\parindent}{0pt}
\setlength{\parskip}{10pt plus 1pt minus 1pt}
\end{verbatim}

This is the first paragraph.

This is the second paragraph. The paragraph indentation is \verb|\the\parindent|.

\begin{verbatim}
\setlength{\parindent}{30pt}
\setlength{\parskip}{10pt plus 1pt minus 1pt}
\end{verbatim}

This now produces:

\begin{verbatim}
This is the first paragraph.
This is the second paragraph. The paragraph indentation is 0.0pt.
\end{verbatim}

In this example, the preferred paragraph gap is 10pt but it will allow for a deviation of up to plus or minus 1pt.

Note that it’s generally best not to change \verb|\parskip| explicitly as it can cause unexpected complications. If you use one of the KOMA-Script classes, such as \verb|scrreprt|, you can use the \texttt{parskip} class option that can take the following values: \texttt{parskip=full} (a full line height) \texttt{parskip=half} (half a line height).

\textbf{Example:}

\begin{verbatim}
\documentclass[\texttt{parskip=full}]{\texttt{scrbook}}
\end{verbatim}

If you want to change any of the page layout lengths (such as \verb|\textwidth|), the easiest way to do it is to use the geometry \texttt{package}. This package should have been installed when you installed your \TeX distribution. For example: suppose you want the total text area to be 6.5in wide and 8.75in high with a left margin of 0.4in, then you would do:

\begin{verbatim}
\usepackage[body={6.5in,8.75in},left=0.4in]{geometry}
\end{verbatim}

\footnote{There are also variants that have +, - or * as a suffix. See the KOMA-Script documentation for further details.}
2.18 Class File

The class file (.cls) defines the page layout, heading styles and various commands and environments needed for a particular type of document. The class file is specified using the command

\documentclass[⟨options⟩]{⟨class-name⟩}

where ⟨class-name⟩ is the name of the file without the .cls extension. All \LaTeX documents must start with this command. This book uses the scrbook class.

2.19 \TeX

\TeX is the typesetting language written by Donald Knuth. He wrote a format of \TeX called Plain \TeX, but many people find Plain \TeX complicated, so Leslie Lamport wrote a format of \TeX called \LaTeX to make it a bit easier to use. You can think of \LaTeX as a go-between converting your instructions into \TeX. This book mostly uses the term \LaTeX, even if the matter is more general to \TeX, to avoid complicating matters. Some error messages you may see will be \LaTeX messages, some will be \TeX messages. \LaTeX error messages tend to be a bit easier to understand than \TeX messages. There are other formats of \TeX, such as ConTeXt, but this book does not cover them.

2.20 Perl

\TeX-distributions such as TeX Live and MiKTeX also include some helper applications that you may find useful. For example, texdoc (Section 1.1) helps you access installed documentation and makeindex helps generate an index for your document. Some of the helper applications are written in a scripting language called Perl, and you must have the perl application installed to be able to use them. Unix-like operating systems should already have it installed. Windows users can choose between several Perl distributions. The most popular seem to be Strawberry Perl and Active Perl. Perl scripts that come with \TeX include: epstopdf (converts Encapsulated PostScript (EPS) files to PDF), pdfcrop (crops a PDF file), xindy (a more flexible indexing application than makeindex), texcount (counts the number of words in a \LaTeX document) and latexmk (runs \LaTeX and any associated applications, such as bibtex, the required number of times to ensure the document is fully up-to-date).
Every time you want to create or edit a \LaTeX\ document, there are three basic steps you will always need to follow:

1. Write or edit the source code.

2. Pass the source code to the latex or pdflatex application ("\LaTeX\ the document").
   - If there are any error messages, return to Step 1.
   - If there are no error messages, a PDF file is created.

3. View the PDF file to check the result. If you need to modify your document, go back to Step 1.

You will therefore need:

1. A text editor (to perform Step 1). For example Vim, Emacs or Gedit.

2. The \TeX\ software (to perform Step 2). If you don't already have \TeX\ on your machine, you will need to install it. The most convenient way to do this is to install from the \TeX\ Collection DVD ROM, which is distributed to all \TeX\ User Group\textsuperscript{3.1} (TUG) members, but you can also download and install free \TeX\ distributions, such as TeX Live, MiKTeX or MacTeX, from the Internet (see on the following page). There is also proTeXt, an enhancement of MiKTeX that aims to be an easy-to-install \TeX\ Distribution. For more information including up-to-date links, go to \url{http://www.ctan.org/starter.html}.

3. A PDF viewer (to perform Step 3). For example Adobe Reader, Sumatra, Evince or Okular.

This can be rather complicated for a beginner, especially for those with no experience writing computer code. Fortunately, there are some all-in-one applications (often called a front-end) that provide a text editor (for Step 1), buttons or menu items to run the latex or pdflatex command-line application (for Step 2) and, in some cases, a viewer to perform Step 3.

\textsuperscript{3.1}\url{http://tug.org/}
Section 3.1 describes one such front-end called TeXWorks. I have chosen to describe TeXWorks because it is a free, cross-platform application. Binaries are available for Microsoft Windows, Mac OS X and GNU/Linux. The screen shots of TeXWorks in this book were taken from the Linux version running under Fedora. If you run TeXWorks on other operating systems, it may have a slightly different look, but it has the same functionality.

New versions of TeX Live and MiKTeX include TeXWorks for MS Windows, and new versions of MacTeX include TeXWorks for Mac OS X users. GNU/Linux users can use their Add/Remove Software utility to install TeXWorks. Alternatively, you can download TeXWorks by following the links provided at http://www.tug.org/texworks/.

If you're confused by all the options, let's keep things as simple as possible:

- MS Windows:
  You have a choice between MiKTeX (or proTeXt) and TeX Live. MiKTeX provides a smaller and quicker installation, but the downside is that you may not have the classes or packages you want to use. MiKTeX can install these whenever you try to \LaTeX a document that uses them, but you need an Internet connection while it does this. TeX Live installs everything, so it takes longer and needs more space, but you should have the majority of packages and classes that you need.

TeX Live:
  1. Fetch and unpack http://mirror.ctan.org/systems/texlive/tlnet/install-tl.zip
  2. Run install-tl and follow the instructions. This can take an hour or more.

proTeXt:
  1. Go to http://tug.org/protext/
  2. Click on the “download the self-extract protext.exe” link to download and run the executable.

MiKTeX:
  1. Go to http://www.miktex.org/
  2. In the left-hand panel, there is a link to the download page for the latest version. At time of writing, it is MiKTeX 2.9. Click on that link.
  3. Scroll down to the section “Installing a basic MiKTeX system”.
  4. If you're happy with the selected mirror location, click on the “Download” button.
  5. Run the executable.

- Mac OS X:
  1. Go to http://tug.org/mactex/
2. Follow the instructions on that page.

- GNU/Linux:

1. Fetch and unpack http://mirror.ctan.org/systems/texlive/tlnet/install-tl-unx.tar.gz
2. Follow the instructions at http://tug.org/texlive/quickinstall.html
3. Once TeX Live has finished installing, run your system’s “Add/Remove Software” tool.
4. Find “texworks”, select the newest version and install.

If you run into problems, there are mailing lists at http://tug.org/mailman/listinfo/tex-live and http://docs.miktex.org/manual/lists.html for TeX Live and MiKTeX, and MacTeX help at http://www.tug.org/mactex/help/. There is also a list of places where you can ask for help in Appendix C (Need More Help?).

3.1 TeXWorks

Hopefully you’ve managed to successfully install TeX and TeXWorks as described above, so let’s test it out.

First run TeXWorks. On Windows, you can access it via the Start menu. On GNU/Linux, it’s probably located in Applications→Office, or you can type texworks in a terminal. You should now see the TeXWorks window. The button marked with a grey triangle in a green circle is the build or typeset function. It runs the application in the drop-down list next to it. This is set to pdfLaTeX, which is what we want for now.

It’s a good idea to switch on the syntax highlighting, if it isn’t already on. This is done via the Format→Syntax Coloring sub-menu. Make sure the LaTeX item is selected.

Next, type in the following sample source code, as shown in Figure 3.1 (the commands used here will be described in more detail in Chapter 4 (Creating a Simple Document)):

\documentclass{scrartcl}
\begin{document}
This is an example document.
\end{document}

Pay close attention to the backslashes at the start of each command name. If you find the font is a bit too small for you, you can make it larger.
using the Format→Font menu item. *This doesn’t affect the font size in your PDF file, just the font size of your code.* This displays the “Select Font” dialog box. Set the font size as appropriate.

Then save the document, using the File→Save As menu item. I called my document example1.tex (remember the .tex extension and stick to file names that only consist of alphabetical characters, digits and hyphens—don’t uses spaces or underscores).

Now that you have saved the file, you can run pdflatex. Make sure the drop-down list next to the build button has “pdflatex” selected and click on the build button. If all goes well, a new window should open displaying the typeset document (Figure 3.2).

Now let’s see what happens if there is an error in the source code. In Figure 3.3 I have misspelt the \documentclass command. This time, when I click on the build button, I get the error message:

```
! Undefined control sequence.
1.1 \documentclass
     {scrartcl}
?
```

(Shown in Figure 3.4.)

Here “Undefined control sequence” means an unrecognised command, and below that message, “1.1” means the error was encountered on line 1. An input line at the bottom of the window has appeared with a cursor. \LaTeX{} is in interactive mode and is awaiting a response. There are several responses, but I’m only going to mention two of them:

1. Type h and press the Return/Enter key \rightarrow. This displays a short help message and awaits a new response (see Figure 3.5).

2. Type x and press Return/Enter. This aborts the \LaTeX{} run.

Notice that the green circle button with the grey triangle has turned into a red stop button. This button can be used to abort the process instead of typing x.

Now, there is a second tab at the bottom of the TeXWork’s window (Figure 3.6). This lists the error message and provides a link to the line where the error occurred. Clicking on this link highlights line 1. Next I need to fix the error by correcting the spelling of the command. Once it’s fixed, I can click on the build button.

Here’s another error you might encounter: I’m now going to misspell the class name. It should be scrartcl, but in Figure 3.7 it has been misspelt. This time, when I click on the build button, I get the error:

```
! \LaTeX{} Error: File ‘scrartc.cls’ not found.
```

I have two choices: type in the correct name on the line below “Enter file name;” or I can abort the process using the red abort button. In either case I need to go back and fix the error in my code.
\documentclass{scrartcl}

\begin{document}

This is an example document.

\end{document}

Enter file name:
Chapter 4

Creating a Simple Document

Having installed and tested the software, let’s now look at how to actually write the source code. The very first line of any document that you create must have the command:

\documentclass[⟨option-list⟩]{⟨class-name⟩}

This tells \LaTeX what type of document you want to create (for example an article, a technical report or correspondence). The \documentclass command takes one mandatory argument, ⟨class-name⟩, that specifies the class file.

There are many class files available, and some publishers, institutions or journals provide their own custom classes (for example, the jmlr class for the Journal of Machine Learning Research). Popular classes include memoir (for books and reports) and those supplied in the KOMA-Script bundle (for books, reports, articles and correspondence). There’s also beamer (for presentations) as well as classes for typesetting exams, flashcards, concert programmes etc. For simplicity, this book will concentrate on three of the KOMA-Script classes scrartcl (for articles), scrreprt (for technical reports, theses etc) and scrbook (for books).

We’ll start with a very simple document, so let’s use the scrartcl class file. In this case the very first line of the source code should be:

\documentclass{scrartcl}

The \documentclass command also takes an optional argument, ⟨option-list⟩, which should be a comma separated list of options to be passed to the class file. This allows you to override the class file defaults. For example, the scrartcl class file by default uses A4 paper, but if you are in the USA you will probably want to use letter paper. This can be achieved using the option letterpaper. So you would need to edit the above line to:

\documentclass[letterpaper]{scrartcl}

Let’s change another option. The normal font size is 11pt by default, but we have the option to change it, so let’s use 12pt:

\documentclass[letterpaper,12pt]{scrartcl}

You can also change your document so that it is in a two-column format using the twocolumn option:

\documentclass[letterpaper,12pt,twocolumn]{scrartcl}

After deciding what type of document you want, you now need to specify the contents of the document. This is done inside the document environment. The document is started with the command:
\begin{document}
and ended with
\end{document}
(\LaTeX{} stops reading the file when it reaches the above line, so anything occurring after it is ignored.)

My source code now looks like:

\begin{verbatim}
\documentclass[12pt]{scrartcl}
\begin{document}
\end{document}
\end{verbatim}

Every document you create must have this form. You can't simply start typing the document text. You must first specify your class file, and then place the contents of the document inside the document environment.

So far so good, but at the moment we have an empty document, so we won't get any output. Let's now put some text into our document:

\begin{verbatim}
\documentclass[12pt]{scrartcl}
\begin{document}
This is a simple document.
Here is the first paragraph.
Here is the second paragraph. As you can see it's a rather short paragraph, but not as short as the previous one.
\end{document}
\end{verbatim}

**Top Five Mistakes Made by New Users**

I first started teaching \LaTeX{} in 1998, and these are the most common errors I've seen when people start learning \LaTeX{}:

1. Missing out the backslash \ at the start of one or more of the commands.
2. Using a forward slash / instead of a backslash \.
3. Forgetting \end{document}.
4. Misspelling “document” (in \begin{document} and \end{document}).
5. Missing a closing brace \}.
If you encounter any problems when you start out, go through that check list first. Then check Appendix B (Common Errors).

Whenever you start a new document, always type in the \documentclass, \begin{document} and \end{document} commands first (Figure 4.1). Then move your cursor between the \begin and \end lines and type the document text (Figure 4.2).

**Exercise 1 (Simple Document)**

Try typing the code in the above example into TeXWorks or the editor of your choice (see Chapter 3 (From Source Code to Typeset Output) if you
can't remember what to do.) You can also download a copy of this file, but I recommend that you try typing it in to give yourself some practice.

Things to note while you are typing: firstly, when you press the return character at the end of a line this end-of-line character is converted into a space in the output file. So the fact that I have some very ragged lines in my source code has no effect on the final result. (Note that some front-ends will reformat your lines as you type.) Whereas a completely blank line will be converted into a paragraph break (\par has the same effect).

Secondly, multiple spaces are converted into a single space, so the large gap between the words “can” and “see” is no different from having a single space.

Once you have typed up your source code, save your file (called, for example, exercise1.tex), and run PDFLaTeX as described in Section 3.1. If all goes well, TeXWorks should display the resulting PDF file in a new window, usually alongside the window containing the source code.

Notes:
1. Each paragraph automatically starts with an indentation in the PDF.
2. There is no blank line between the paragraphs in the PDF document. (See what happens if you add the KOMA-Script class option parskip=full:
   \documentclass[12pt,parskip=full]{scrartcl}
   \begin{document}
   and rebuild the PDF.)
3. Move the mouse over one of paragraphs in the PDF viewer and pop-up the context menu (usually a right mouse click). Select Jump to Source. The window containing the source code should now gain the focus and the line of code matching the typeset line you clicked on in the PDF should now be highlighted.

4.1 Using Simple Commands

Now let's try adding a few simple commands to our document. The command \LaTeX produces the \LaTeX logo and the command \today prints the current date. \LaTeX always ignores any spaces that follow a command name that consists of letters, as it uses the space to indicate the end of the command name. This means that if we want a space to occur immediately after the command, we need to explicitly say so using the command \␣ (recall from page 8 ⸣ indicates a space character). So, for example:
\LaTeX \␣ logo
produces the output:
\LaTeX logo
Some people when starting out can get a bit confused by this and read it as the entity "\LaTeX\" whereas it is in fact two commands: \LaTeX\ (print the \LaTeX\ logo) followed "\ " (print a space.)

Let's also try using a command that takes an argument. The command
\footnote{(text)}

takes one argument that specifies the text that should appear in the footnote. This command must be placed where you want the footnote marker to appear.

**Exercise 2 (Using Simple Commands)**

Edit the document you created in Exercise 1, so that it looks like the following: (You can download it if you like, but again it is better if you try typing it in yourself.)

\documentclass[12pt]{scrartcl}
\begin{document}
This is a simple \LaTeX\ document. Here is the first paragraph.

Here is the second paragraph\footnote{with a footnote}. As you can see it's a rather short paragraph, but not as short as the previous one. This document was created on: \today.
\end{document}

Now \LaTeX\ your document and view the result. (Remember to check Appendix B (Common Errors) if you have a problem.) You should see the \LaTeX\ logo, the footnote marker and the current date. If you scroll down to the bottom of the page, you should see the footnote.

-----

### 4.2 Packages

Packages are files with the extension .sty that either define new commands or redefine existing commands. They're like a type of add-on or plug-in. Most of the commonly used packages should have been installed when you installed your \TeX\ distribution (see Chapter 3 (From Source Code to Typeset Output)). Appendix A (Downloading and Installing Packages) covers how to install new packages. Most packages come with documentation that can be accessed using the \texdoc\ application described in Section 1.1.

Packages are loaded in the preamble (after \documentclass and before \begin{document}) using
\usepackage[(option list)]{(package)}
where \textit{package} is the name of the package and \textit{option list} is a list of comma-separated options. For example, to load the package graphicx with the draft option:

\begin{verbatim}
\usepackage[draft]{graphicx}
\end{verbatim}

Any applicable class options are also passed to packages, so in

\begin{verbatim}
\documentclass[draft]{scrartcl}
\usepackage{graphicx}
\end{verbatim}

the draft option is set for both the \texttt{scrartcl} class and the graphicx package.

You can specify more than one package in the argument of \texttt{usepackage}, where each package name is separated by a comma. For example:

\begin{verbatim}
\usepackage{amsmath,amsfonts}
\end{verbatim}

The graphicx package is covered in Chapter 6 (The graphicx Package) and the amsmath package is covered in Chapter 9 (Mathematics), so let’s start out with a relatively simple example.

### 4.2.1 Changing the Format of \texttt{\today}

In the previous exercise, we used the \texttt{\today} command to produce the current date. By default, this command displays the date in US format. To illustrate how to use packages, this section will look at how to use the datetime package to change the way that \texttt{\today} displays the date.

The datetime package has various options that can be used to change the format of \texttt{\today}. For example, by default the datetime package redefines \texttt{\today} to display the date in the form: Tuesday 25\textsuperscript{th} September, 2012. The option \texttt{short} will produce an abbreviated form, (for example Tue 25\textsuperscript{st} Sept, 2012) and the option \texttt{nodayofweek} won’t display the day of the week (for example 25\textsuperscript{th} September, 2012). For those who don’t like the raised ordinal, there is the \texttt{level} option. These can be passed as a comma separated list in the \texttt{optional argument} to the \texttt{usepackage} command. It is also possible to use a declaration instead. For example, to redefine \texttt{\today} to display the date in the form 25/09/2012, you can either do

\begin{verbatim}
\usepackage[ddmmyyyy]{datetime}
\end{verbatim}

or

\begin{verbatim}
\usepackage{datetime}
\ddmmyyyydate
\end{verbatim}

The datetime package also defines the command

\begin{verbatim}
\currenttime
\end{verbatim}

which displays the current time, where again the format can be changed by the package options. So the option \texttt{12hr} will cause \texttt{\currenttime} to display
the date in 12 hour format (for example, 3:22pm) and the option 24hr will cause \currenttime to display the date in 24 hour format (for example, 15:22).

Exercise 3 (Using the datetime Package)

Edit your document from Exercise 2 so that it uses the datetime package. Experiment with the different package options, for example
\usepackage[short,nodayofweek,level,12hr]{datetime}
and add the current time
This document was created on: \today at \currenttime.

You can download or view an example. For a full list datetime of package options, see the datetime documentation. (Refer to Section 1.1 on how to find package documentation.)

4.3 Special Characters and Symbols

You can use most of the standard characters that you find on your keyboard, but the 10 symbols shown in Table 4.1 have a special meaning.

Table 4.1 Special Characters

{ } % & $ # _ ^ ~ \n
We have already used the curly braces { and }. The percent symbol % is a comment character. Everything from the percent symbol up to the end of line is ignored by \LaTeX. This means you can have comments in your source code to remind you what a particular part of your code is doing. We have also used the backslash symbol \ which indicates that we are using a \LaTeX command, as in \LaTeX or \today. The meaning of the other special characters will be covered later.

So what do you do if you want one of these symbols to actually appear in your document? Table 4.2 lists commands that produce these and other symbols. Note that some of the commands have short cuts, such as --- instead of \textemdash and ?‘ instead of \textquestiondown.

The symbol ‘ is the backtick (or grave) symbol, as opposed to the apostrophe symbol ’. The backtick symbol usually looks like ` on a keyboard, and on most UK keyboards it is situated to the left of the 1 key. The opening double quote is created using two adjacent backtick symbols and the closing double quote with two adjacent apostrophe symbols. This gives 66 and 99 style quotes, which you wouldn't get using the double quote symbol on your keyboard.

Note that the symbols | < and > have to be created using \textbar, \textless and \textgreater when in normal text mode. If you try to enter them using the corresponding keyboard characters you may get — ¡ and ¿.

[FAQ: Where can I find the symbol for ... ?]
[FAQ: How to get copyright, trademark, etc]
(They do however work if you are in maths mode.) The slash character / may be used directly, as in “and/or”, but no line break will be permitted at the slash, whereas \slash (as in “and\slash or”) will allow a line break at that point.

Table 4.2 Symbols

\textbackslash
\textasciicircum
\textbackslash
\textgreater
\textless
	extregistered
\texttrademark
\copyright
\textbullet
\ldots
\P

Ligatures and special symbols are shown in Table 4.3. (Note that, as mentioned in the introduction, the f-ligatures are automatically converted.) When using a command in the middle of a word, take care that the command doesn’t run into the rest of the word. For example, the British spelling of the word manœuvre has an œ-ligature in the middle of it. You will get an error if you try:

\texttt{man\oeuvre}

as L\TeX\ will interpret it as the command \oeuvre which doesn’t exist.

There are several ways to code this in L\TeX:\

1. Place a space after the command:

   \texttt{man\ oe\_uvre}

2. Place an empty brace after the command:

   \texttt{man\oe{}uvre}

3. Group the command:

   \texttt{man\{\oe\}uvre}

   (This can adversely affect the kerning so is best avoided.)

   English speakers are by and large very lackadaisical when it comes to accents, but accents affect pronunciation, and so are just as important as the correct spelling. There is a big difference between putting your knife

---There are also some text fonts that will display them correctly, but don’t rely on it.
into someone’s pâté (meat paste), and putting your knife into someone’s pate (head)!

Accented letters are created by specifying which accent you want, and the letter on which to put the accent. The accent commands are listed in Table 4.4, and each command takes one mandatory argument. The command indicates what accent to use, and the argument indicates the letter on which to put the accent.

You may have noticed in Table 4.2 the commands \i and \j which produce a dotless i and j (ı and ȷ). With old versions of \LaTEX (or \TeX) an accent over a normal “i” or “j” left the original dot in, which is incorrect, so a dotless “ı” or “ȷ” were required. With modern distributions, an accented “ı” or “ȷ” is correctly rendered.

**EXAMPLE:**

Input

It’s na\"ive to think that eating mouldy p\^at\'e won’t result in food poisoning.

Output

It’s naïve to think that eating mouldy pâté won’t result in food poisoning.

<table>

</tbody>
</table>

This book only covers a very small subset of available symbol commands. If the command you want isn’t here, try Scott Pakin’s comprehensive symbol list [10]. Another useful resource is detexify.
4.3.1 The inputenc Package

Instead of using the accent and ligature commands described above, you can use the inputenc package and enter the character directly, but you must ensure you match the encoding with that used by your text editor. For example, this book uses UTF8 encoding so I have loaded the inputenc package in the preamble with the utf8 option:

\usepackage[utf8]{inputenc}

Note that it's a good idea to also use the fontenc package as well. For example, if you want to use Type 1 fonts:

\usepackage[T1]{fontenc}
\usepackage[utf8]{inputenc}

Returning to an earlier example, I can directly enter the Unicode character (U+0153) for the lower case œ ligature:

manoeuvre

Note that if you are collaborating on a document and you want to use this approach, you must ensure that all your co-authors use the same input encoding. For example, suppose you decide to use ISO Latin 1 encoding (latin1 option):

\usepackage[latin1]{inputenc}

but your co-author is using a UTF-8 editor and types:

naïve

where ï is the Unicode character U+00EF. UTF-8 characters use one to four 8-bit bytes whereas ISO Latin 1 uses an 8-bit single-byte character set. So the U+00EF binary sequence is interpreted by ISO Latin 1 encoding as two characters: Å (0xC3) and ¯ (0xAF). Therefore the resulting PDF file will end up containing the rather odd looking:

naÅ¯ve

(If you are using TeXWorks, you can set your preferred encoding using Edit→Preferences and select the “Editor” tab where there is an “Encoding” setting. Make sure this setting matches the inputenc option you use in your document.)

Exercise 4 (Using Special Characters)

Start a new file in TeXworks, and see if you can write the source code to create the output below. (Ignore any hyphenation that may appear below, \LaTeX does that automatically where necessary, see Section 2.14. Likewise, ignore where the line breaks occur, except for the paragraph break.) Choose whether you want to use the inputenc package or if you want to use commands such as \c, but in either case you need to be careful of the special characters.
Item #1: Our travel expenditure came to $2000.00 & our equipment expenditure came to £100.00 plus VAT @ 17.5%.
Chloë collected Zoë from the crèche. They stopped to admire the façade of a new café and then went to a matinée.

You can download or view the source code if you can’t work out how to do it, and remember to check Appendix B (Common Errors) if you have a problem.

4.4 Lists

Now you’ve had a go at using some commands, let’s use some environments (recall Section 2.15). A good example of environments are the list making environments. There are three basic list making environments: \texttt{itemize} (for unordered lists), \texttt{enumerate} (for ordered lists) and \texttt{description} (for lists where you want to specify your own label.)

In each of these environments, each item in the list must be started with the command:

\begin{itemize}
\item Animal
\item Vegetable
\end{itemize}

The optional argument $\langle\text{marker}\rangle$ can be used to override the default marker for that particular item. (For example, to replace the bullet point for an individual item in an unordered list to make that item stand out from all the other items.) We will be looking at how to change the default marker in Section 8.2.

\textbf{Related UK FAQ [18] topics:}

- Perhaps a missing \texttt{item}?
- Fancy enumeration lists
- How to adjust list spacing
- Interrupting enumerated lists
- “Too deeply nested”

4.4.1 Unordered Lists

Unordered lists are created using the \texttt{itemize} environment.

\texttt{Example:}

\begin{itemize}
\item Animal
\item Vegetable
\end{itemize}
\item Mineral
\end{itemize} \begin{itemize}
\item Animal
\item Vegetable
\item Mineral
\end{itemize}

**Another Example:**
Changing the default markers is covered in Section 8.2, but it’s also possible to override the default marker for a particular item, as in this example (recall the double-dagger symbol command \ddag from Table 4.2):
\begin{itemize}
\item Animal
\item[\ddag] Vegetable
\item Mineral
\end{itemize}

Be careful about using square brackets \[\] inside an optional argument. Grouping is required, as in:
\begin{itemize}
\item Animal
\item[{{X}}] Vegetable
\item Mineral
\end{itemize}

Similarly if the item starts with an open square bracket \[, as in:
Nested Lists

It is also possible to nest \texttt{itemize} environments. The following example has three levels, each using its own default marker.

\begin{itemize}
  \item Animal
  \begin{itemize}
    \item Mammals
    \item Birds
    \item Reptiles. For example:
    \begin{itemize}
      \item dinosaurs
      \item crocodiles
    \end{itemize}
  \end{itemize}
  \item Vegetable
  \begin{itemize}
    \item Cultivated
    \item Wild
  \end{itemize}
  \item Mineral
\end{itemize}
* dinosaurs
* crocodiles

- Vegetable
  - Cultivated
  - Wild

- Mineral

You might have noticed the code in the above example is a little difficult to read. Each new list item starts a new paragraph, so it doesn’t matter if we have blank lines before each item. Also, recall from Chapter 2 (Some Definitions) that spaces at the start of each line of code are ignored, so it’s possible to make the code more readable without affecting the final result:

```latex
\begin{itemize}
  \item Animal
    \begin{itemize}
      \item Mammals
      \item Birds
      \item Reptiles. For example:
        \begin{itemize}
          \item dinosaurs
          \item crocodiles
        \end{itemize}
    \end{itemize}
  \item Vegetable
    \begin{itemize}
      \item Cultivated
      \item Wild
    \end{itemize}
\end{itemize}
```
It’s now a little easier to see which \begin{itemize} matches up with the corresponding \end{itemize}.

**Example (Four Levels)**

This example has four levels, which is the maximum allowed by most classes.

\begin{itemize}
\item Animal
  \begin{itemize}
  \item Mammal
    \begin{itemize}
    \item Placental
    \item Monotreme
      \begin{itemize}
      \item Platypus
      \end{itemize}
    \item Marsupial
      \begin{itemize}
      \item Kangaroo
      \item Koala
      \end{itemize}
    \end{itemize}
  \item Reptile
  \item Vegetable
  \item Mineral
  \end{itemize}
\end{itemize}
• Animal
  – Mammal
    ∗ Placental
    ∗ Monotreme
      · Platypus
    ∗ Marsupial
      · Kangaroo
      · Koala
  – Reptile
• Vegetable
• Mineral

If you try adding a further level, \LaTeX\ will give a "Too deeply nested" error.

4.4.2 Ordered Lists

Ordered lists are created using the `enumerate` environment. It has exactly the same format as the `itemize` environment described above.

We can use the same example as before, only this time use `enumerate` instead of `itemize`.

```
\begin{enumerate}
\item Animal
\item Vegetable
\item Mineral
\end{enumerate}
```

The above input will produce the following output:

1. Animal
2. Vegetable
3. Mineral

As before, the marker for a particular item can be overridden:
\begin{enumerate}
\item Animal
\item Vegetable
\item Mineral
\end{enumerate}

1. Animal
[X] Vegetable
2. Mineral

\textbf{Example (Nested)}:
As with the \texttt{itemize} environment, most classes allow a maximum of four nested \texttt{enumerate} environments.

\begin{enumerate}
\item Animal
\begin{enumerate}
\item Mammal
\begin{enumerate}
\item Placental
\item Monotreme
\begin{enumerate}
\item Platypus
\end{enumerate}
\item Marsupial
\begin{enumerate}
\item Kangaroo
\item Koala
\end{enumerate}
\end{enumerate}
\item Reptile
\end{enumerate}
\end{enumerate}
\item Vegetable
\item Mineral
\end{enumerate}

1. Animal
   a) Mammal
      i. Placental
      ii. Monotreme
         A. Platypus
      iii. Marsupial
         A. Kangaroo
         B. Koala
   b) Reptile

2. Vegetable
3. Mineral

\begin{description}
\item[Animal] Living being
\item[Vegetable] Plant
\item[Mineral] Natural inorganic substance
\end{description}

\textbf{4.4.3 Description Environment}

The \texttt{description} environment has the same format as the \texttt{itemize} environment described in Section 4.4.1, only this time you need to specify a marker as an \textit{optional argument} to the \texttt{item} command, since there is no default marker for this environment. The marker may be a textual label, and most classes will typeset it in bold. The KOMA-Script classes, such as \texttt{scrartcl}, default to a bold sans-serif font, as illustrated in this next example:

\begin{verbatim}
\begin{description}
 \item[Animal] Living being
 \item[Vegetable] Plant
 \item[Mineral] Natural inorganic substance
\end{description}
\end{verbatim}

\textbf{Animal} Living being
Vegetable \ Plant

Mineral Natural inorganic substance

The KOMA-Script classes provide a way of changing the font style in the \textit{description} label markers. (The font changing commands \texttt{\normalfont} and \texttt{\textsc{scshape}} will be covered in Section 4.5, and the KOMA-Script command \texttt{\addtokomafont} in Section 5.3.)

\begin{description}
\item[Animal] Living being
\item[Vegetable] Plant
\item[Mineral] Natural inorganic substance
\end{description}

It is possible to nest all the listing environments, as long as you don’t exceed four \itemize and four \enumerate environments. The \textit{description} environment has no restriction on the number of times it can be nested. However, just because you can do something, doesn’t mean you should. In general it’s best to avoid an excessively complicated block of text in your document.

\textbf{Example (Assorted Nesting):}
This example uses each of the listing environments described above.
\item Reptiles. For example:
\begin{enumerate}
\item dinosaurs
\item crocodiles
\end{enumerate}
\end{itemize}

\item Vegetable Plant
\begin{itemize}
\item Cultivated. For example:
\begin{enumerate}
\item Carrots
\item Broccoli
\item Potatoes
\end{enumerate}
\item Wild
\end{itemize}

\item Mineral Natural inorganic substance

\end{description}

\section*{Animal Living being}
\begin{itemize}
\item Mammals
\item Birds
\item Reptiles. For example:
  \begin{enumerate}
  \item dinosaurs
  \item crocodiles
  \end{enumerate}
\end{itemize}

\section*{Vegetable Plant}
• Cultivated. For example:
  1. Carrots
  2. Broccoli
  3. Potatoes
• Wild

**Mineral** Natural inorganic substance

---

**Exercise 5 (Lists)**

Try writing the source code that will create the output shown below.

---

**Village** A small collection of dwelling places. Examples:
  1. Marlingford
  2. Saxlingham Nethergate

**Town** A large collection of dwelling places. Examples:
  1. Great Yarmouth
  2. Beccles

**City** A large town, usually containing a cathedral. Examples:
  1. Norwich
  2. Birmingham
  3. London

---

You can [download](#) or [view](#) the answer if you can’t work out how to do it.

4.5 **Fonts**

**\LaTeX** uses Donald Knuth’s Computer Modern fonts by default. This supplies three font families: serif, sans-serif and a typewriter (or monospaced) font (as well as the maths fonts which are discussed in Section 9.4.1). With each font family, you can change the shape and weight, as well as the size.
4.5.1 Changing the Font Style

There are two basic ways of changing fonts: you can either change the font for a small selection of text, for example, if you want to emphasize a word, or you may wish to change the font “from this point onwards”. The commands shown in Table 4.5 are of the first type (text-block commands), whereas those shown in Table 4.6 are of the second type—a declaration (or modal command).

Note:
Don’t be tempted to use \bf, \md, \it, \sl, \sc, \sf, \tt or \rm. These commands are obsolete [15].

If you use an italic or slanted font declaration, such as \itshape, you will need to add an italic correction \slash at the end of the block of text, when the last letter of the sloping text leans too far over. This isn’t necessary for text-block commands, such as \textit, just for the modal commands. The effect is more noticeable when part of a word is stressed, particularly with certain fonts.

Example:
In the code below, the first instance of “repeated” doesn’t have an italic correction but the second does:

\{\itshape repeated\}ly {\itshape repeated/\}ly

Using Computer Modern:

repeatedly repeatedly

Using Helvetica:

repeatedly repeatedly

Using Antykwa Toruńska typeface:

repeatedly repeatedly

Note that if you want to typeset an URL, rather than using \texttt it is better to use

\url{⟨address⟩}

which is defined in the url package. For example:

\url{http://theoval.cmp.uea.ac.uk/~nlct/}

produces:

http://theoval.cmp.uea.ac.uk/~nlct/

(Note there is no need to do anything with the ~ (tilde) special character if you use it in the argument of \url.)

Environments can be used instead. Each environment has the same name as its corresponding declaration, but without the preceding backslash. For example:

\begin{sffamily}Some sans-serif text.\end{sffamily}

yields:
### Table 4.5 Font Changing Text-Block Commands

<td>SMALL CAPS TEXT</td>
</tr>
<tr>
<td>\em</td>
<td>\em emphasized text</td>
<td>emphasized text</td>
</tr>
<tr>
<td>\normalfont</td>
<td>\normalfont default text</td>
<td>default text</td>
</tr>
</tbody>
</table>
Some sans-serif text.

You can combine a font family with a given shape and weight using a variety of methods.

**EXAMPLES:**

1. Localised declarations:
   ```latex
   \textsf{\slshape} Some slanted sans-serif text.
   ```

2. Declarations that later get explicitly reset:
   ```latex
   \textsf{\textsl{Some slanted sans-serif text.}}
   ```

3. Mixing text-block and modal commands:
   ```latex
   \textsf{\slshape} Some slanted sans-serif text.
   ```

4. Nested commands:
   ```latex
   \textsf{\textsc{Some slanted sans-serif text.}}
   ```

5. Mixing environments and declarations:
   ```latex
   \begin{textsf}{\textsc{Some slanted sans-serif text.}}\end{textsf}
   ```

All of the above produce the same output:

*Some slanted sans-serif text.*

Note that some combinations are not available, in which case LaTeX will give a warning message, and will substitute the font for what it considers to be the closest available match.

**EXAMPLE:**

```latex
\textsc{\bfseries Text}
```

With the Antykwa Toruńska typeface, this appears as:

**Text**

whereas with Computer Modern, the result is:

**Text**

This is because Computer Modern doesn’t have a bold small-caps font, so it just uses bold. LaTeX gives the following warning:

LaTeX Font Warning: Font shape ‘T1/cmr/b/sc’ undefined
(Font) using ‘T1/cmr/b/n’ instead on input line 2792.
Most sans-serif fonts don’t provide a small-caps variant, so
\textsf{\scshape Text}
will either appear in regular sans-serif or small-caps serif, depending on the
font in use. Using Libris sans-serif the result is:
Text
whereas using Computer Modern Sans, the result is:
TEXT

Emphasizing Words or Phrases

The command \emph, the declaration \em and the environment em behave
slightly differently to the corresponding \textit command, \itshape declaration and
itshape environment. The latter group simply use an italic font,
whereas the former will toggle between sloping and upright. So if the sur-
rounding font is upright then \emph, \em and em will use the sloping font,
but if the surrounding font is italic or slanted, \emph, \em and em will use
an upright font. This is particularly useful in abstracts where the abstract
font varies between class files. It is recommended that if your intention is
to emphasize something, you should use \emph etc. rather than \textit etc.

Examples:
1. Emphasized text in upright surrounding:
   Some \emph{emphasized} text.
   Input
   yields
   Some emphasized text.
   Output

2. Emphasized text in italic surrounding:
   {\itshape Some \emph{emphasized} text.}
   Input
   yields
   Some emphasized text.
   Output

3. Emphasized text in upright sans-serif surrounding:
   {\sffamily Some \emph{emphasized} text.}
   Input
   yields
   Some emphasized text.
   Output
4.5.2 Changing the Font Size

When you start writing a document, you need to decide what the base font size should be. The KOMA-Script classes default to 11pt, but this can be changed using the class options 8pt, 9pt, 10pt, 12pt, 14pt, 17pt or 20pt.

You can then change the font size relative to the base size, using one of the declarations shown in Table 4.7. That way, if you later decide to change the normal font size from, say, 11pt to 12pt, all you need do is change the class option (see page 38) and re-run \LaTeX. Note that there are no equivalent text-block commands.

Table 4.7 Font Size Changing Declarations

<table>
<thead>
<tr>
<th>Declaration</th>
<th>Example Input</th>
<th>Corresponding Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>\tiny</td>
<td>\tiny tiny text</td>
<td>tiny text</td>
</tr>
<tr>
<td>\scriptsize</td>
<td>\scriptsize script size</td>
<td>script size</td>
</tr>
<tr>
<td>\footnotesize</td>
<td>\footnotesize footnote size</td>
<td>footnote size</td>
</tr>
<tr>
<td>\small</td>
<td>\small small text</td>
<td>small text</td>
</tr>
<tr>
<td>\normalsize</td>
<td>\normalsize normal size</td>
<td>normal size</td>
</tr>
<tr>
<td>\large</td>
<td>\large large text</td>
<td>large text</td>
</tr>
<tr>
<td>\Large</td>
<td>\Large even larger</td>
<td>even larger</td>

<td>larger still</td>
</tr>
<tr>
<td>\huge</td>
<td>\huge huge</td>
<td>huge</td>
</tr>
<tr>
<td>\Huge</td>
<td>\Huge extra huge</td>
<td>extra huge</td>
</tr>
</tbody>
</table>

Again, environments can be used instead, where each environment has the same name as its corresponding declaration, but without the preceding backslash. Font environments may be nested, for example:

\begin{itshape} Some italic text. \begin{Large}This text is large.\end{Large} \end{itshape} Back to normal.

Output:

Some italic text. This text is large. Back to normal.

4.5.3 Changing Document Fonts

What if you don't want to use the default Computer Modern fonts? Some publishers and institutions insist on a combination of Times Roman (serif), Helvetica (sans-serif) and Courier (typewriter). To do this, you can load the following packages:

- mathptmx (Times) Only affects \textit and \textbf.
- helvet (Helvetica) Only affects \textit and \textbf.
- courier (Courier) Only affects \ttfamily and \texttt.
Notes:

1. Don’t be tempted to use the times package. It’s obsolete [15]. Use mathptmx instead.

2. Although Times and Helvetica are commonly used together, they don’t match, as illustrated below (temporarily switching from this book’s fonts to Times and Helvetica):

\[
\texttt{\textbf{xx}} \ \texttt{\textit{xx}} \ \texttt{xx} \ \texttt{xx}
\]

Results in:

\[
\texttt{xx} \ \texttt{xx}
\]

The first two x’s are in Times Roman and the second two are in Helvetica, which are somewhat larger. To compensate for this you need to scale the Helvetica font using the scaled option:

\[
\texttt{\usepackage[scaled=0.9]{helvet}}
\]

3. Loading helvet or courier doesn’t change the default font family. Consider the following:

\[
\texttt{\documentclass[scrartcl]} \\
\texttt{\usepackage[helvet]} \\
\texttt{\begin{document}} \\
\texttt{This is a sample document.} \\
\texttt{\end{document}}
\]

Here, the text “This is a sample document” will be typeset in Computer Modern Roman. This is because \texttt{\textbf{xx}} is the default font and helvet only affects \texttt{\textit{xx}}, which hasn’t been used. (See Section 8.2 to find out how to change the default font family.)

This book has used the following packages:

\[
\texttt{\usepackage[T1]{fontenc}} \\
\texttt{\usepackage[math]{antrtor}} \\
\texttt{\usepackage{libris}}
\]

The fontenc package is used to switch to Type 1 font encoding, the antrtor package is used to set the serif family to Antykwa Toruńska typeface, and the libris package is used to set the sans-serif family to the Libris ADF typeface.

Exercise 6 (Fonts)

Go back to the document you created in Exercise 1 and change the first paragraph to a large bold font and the second paragraph to normal size italic. Emphasize the words “simple” and “short”. (Again, you can download or view the solution.)
If you like, you can try experimenting with loading different font packages, such as \texttt{mathptmx}, to change the default typeface. The \LaTeX{} Font Catalogue \cite{2} provides a useful list of fonts, although you may not have all of them installed.

\section*{4.6 Aligning Material in Rows and Columns}

Text can be aligned in rows and columns using the \texttt{tabular} environment.

\begin{verbatim}
\begin{tabular}⟨\pos⟩\{⟨column specifiers⟩\}
\end{tabular}
\end{verbatim}

This \textit{environment} has a \textit{mandatory argument} \textit{⟨column specifiers⟩} that specifies how to align each column. Within \textit{⟨column specifiers⟩}, there must be a specifier for each column. The three basic are: \texttt{r} (right aligned), \texttt{l} (left aligned) and \texttt{c} (centred). (Make sure you don’t confuse \texttt{l} (the letter "ell") with \texttt{1} (the digit one).) The \textit{optional argument} \textit{⟨pos⟩} is covered in \textit{Section 4.7}.

\textbf{Example:}

Three columns (\texttt{l}, \texttt{c}, \texttt{c}):

\begin{verbatim}
\begin{tabular}{lcc}
\end{tabular}
\end{verbatim}

\textbf{Another Example:}

Four columns (\texttt{l}, \texttt{c}, \texttt{c}, \texttt{r}):

\begin{verbatim}
\begin{tabular}{lccr}
\end{tabular}
\end{verbatim}

The \texttt{r}, \texttt{l} and \texttt{c} specifiers don’t allow line breaks or paragraphs within a cell. It’s not a good idea to have too much text in a cell, but if it’s required you can use

\begin{verbatim}
p\{⟨width⟩\}
\end{verbatim}

which indicates a paragraph cell of the given width.

\textbf{Example:}

Three columns (paragraph of width 1\texttt{in}, \texttt{c}, \texttt{r}):

\begin{verbatim}
\begin{tabular}{p{1in}cr}
\end{tabular}
\end{verbatim}

The paragraph cell will be formatted fully justified, which is often inappropriate for a narrow block of text. The \texttt{array} package provides

\begin{verbatim}
>\{⟨declaration⟩\}
\end{verbatim}

which can be used directly in front of the \texttt{l}, \texttt{c}, \texttt{r} or \texttt{p} column specifiers. This inserts \textit{⟨declaration⟩} in front of the entries for that column, so it can be used to insert, say, \texttt{\raggedright}.

\textbf{Example:}

Three columns, the first \texttt{left} justified where each entry is in bold, the second a paragraph column of width 1\texttt{in} set to \texttt{ragged right} and the third \texttt{centered}:
The array package also provides \langle\{declaration\}\rangle which can be used directly after the l, c, r or p column specifiers. This inserts \langle\{declaration\}\rangle after the entries for that column.

**Inter-Column Gap:**
The gap between columns is given by twice the value of the length register:

\begin{verbatim}
\tabcolsep
\end{verbatim}

A gap of \tabcolsep is also inserted before the first column and after the last column. This length can be changed using one of the commands described in Section 2.17. For example:

\begin{verbatim}
\setlength{\tabcolsep}{4pt}
\end{verbatim}

This will put an 8pt gap between columns and a 4pt gap before the first column and after the last column.

The column specifiers can also include:

@\{\{inter-column text\}\}

This inserts \{\{inter-column text\}\} at that place on each row of the table, replacing the default inter-column gap.

**Example:**
Suppose we want a centred first column, a right justified second column and a left justified third column with a dot between the second and third columns:

\begin{verbatim}
\begin{tabular}{cr@{.}l}
\end{verbatim}

Alternatively, you may want a larger gap between groups of columns, for example, two groups of three left justified columns:

\begin{verbatim}
\begin{tabular}{lll@{\hspace{4\tabcolsep}}lll}
\end{verbatim}

This uses the command:

\begin{verbatim}
\hspace{\{length\}}
\end{verbatim}

which inserts a horizontal space of a given length. In this case, four times the value of \tabcolsep. This makes the gap between the third and fourth columns twice as wide as the gap between the other columns.

### 4.6.1 Column and Row Separation

Remember the special characters mentioned in Section 4.3? The ampersand character & is used to separate column entries. Rows are separated using:

\begin{verbatim}
\hspace{\{vertical space\}}
\end{verbatim}
where \(\text{vertical space}\) is extra vertical spacing between rows, if required. There is also a longer equivalent:

\[
\texttt{\tabularnewline}
\]

\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
DVD & 15.00 \\
Total & 33.10
\end{tabular}

\[
\texttt{\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
DVD & 15.00 \\
Total & 33.10
\end{tabular}}
\]

\textit{Definition}

\texttt{\tabularnewline}

If you have used something like \texttt{>{\raggedright}p{\langle length\rangle}} as the specifier for your last column, you must use \texttt{\tabularnewline} instead of \texttt{\\} to indicate the row break otherwise you will get the following error:

\texttt{! Extra alignment tab has been changed to \cr.}

\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
DVD & 15.00 \\
Total & 33.10
\end{tabular}

\texttt{\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
DVD & 15.00 \\
Total & 33.10
\end{tabular}}

\textit{Example:}

Let’s have two columns, the first left justified and the second right justified:

\[
\texttt{\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
DVD & 15.00 \\
Total & 33.10
\end{tabular}}
\]

Recall from \textit{Chapter 2 (Some Definitions)} that \LaTeX ignores spaces at the start of a line and treats multiple spaces as a single space, so I could just have easily done:

\[
\texttt{\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
DVD & 15.00 \\
Total & 33.10
\end{tabular}}
\]

and still have got the same result, but now the code is easier to read.

Entries form implicit \texttt{grouping}, so \texttt{declarations} made within a \texttt{tabular} environment only have an effect up to the next \texttt{&} or \texttt{\\}.

\textit{Example:}

\[
\texttt{\begin{tabular}{lr}
Video & 8.99 \\
CD & 9.11 \\
\end{tabular}}
\]
Let's add an extra column and a header row:

\begin{tabular}{lrr}
  Item & ex VAT & inc VAT \\
  Video & 8.99 & 10.56 \\
  CD & 9.11 & 10.70 \\
  DVD & 15.00 & 17.63 \\
  \textbf{Total} & 33.10 & 39.89
\end{tabular}

Example (Aligning on a Decimal Point):
If you want to align on the decimal point, it's best to use the \texttt{siunitx} package. That's beyond the scope of this book, but for simple data this can be achieved using the \texttt{@} inter-column specifier. For example:

\begin{tabular}{lr@{.}l}
  Video & 8 & 99 \\
  CD & 9 & 11 \\
  DVD & 15 & 00 \\
  \textbf{Total} & 33 & 10
\end{tabular}
4.6.2 Spanning Columns

You may have noticed I omitted the column headers in the above example. The problem with rewriting the table using \texttt{r@{.}} to align the decimal point is that the header now needs to span the last two columns. This can be done using the command:

\begin{verbatim}
\multicolumn{⟨cols\ spanned⟩}{⟨col\ specifier⟩}{⟨text⟩}
\end{verbatim}

The first mandatory argument \texttt{(cols\ spanned)} is the number of columns you want to span, the second argument \texttt{(col\ specifier)} indicates how to align this column-spanning entry, the third argument \texttt{(text)} indicates what should go in this entry. Note that \texttt{(col\ specifier)} should only have a single column specifier, such as \texttt{c} or \texttt{r}. We can use \texttt{multicolumn} to modify an earlier example as follows:

\begin{verbatim}
\begin{tabular}{lrr}
Item & \multicolumn{2}{c}{Price (\pounds)} \\
Video & 8.99 & 10.56 \\
CD & 9.11 & 10.70 \\
DVD & 15.00 & 17.63 \\
\textbf{Total} & 33.10 & 39.89
\end{tabular}
\end{verbatim}

\begin{verbatim}
\begin{tabular}{lrr}
\textbf{Price (£)} \\
\textbf{Item} & \textbf{ex VAT} & \textbf{inc VAT} \\
\textbf{Video} & 8.99 & 10.56 \\
\textbf{CD} & 9.99 & 11.74 \\
\textbf{DVD} & 15.00 & 17.63 \\
\textbf{Total} & 33.98 & 39.93
\end{tabular}
\end{verbatim}

Here we are spanning two columns, so the first argument to \texttt{multicolumn} is \texttt{2}, we want the entry centred, so the second argument is \texttt{c} and the text to go in this entry is simply \texttt{Price (\pounds)}.

The \texttt{multicolumn} command can also be used to override the alignment of individual entries. Consider the following example:
\begin{tabular}{lrr}
& Year1 & Year2 \\
Travel & 100,000 & 110,000 \\
Equipment & 50,000 & 60,000
\end{tabular}

Output:

<table>
<thead>
<tr>
<th></th>
<th>Year1</th>
<th>Year2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Travel</td>
<td>100,000</td>
<td>110,000</td>
</tr>
<tr>
<td>Equipment</td>
<td>50,000</td>
<td>60,000</td>
</tr>
</tbody>
</table>

In this example, the headers “Year1” and “Year2” would look better centred, but the rest of the entries in the second and third columns look best right aligned. We can use \texttt{\textbackslash multicolumn} to span just one column, and use the second argument of \texttt{\textbackslash multicolumn} to override the column specification:

\begin{tabular}{lrr}
& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2} \\
Travel & 100,000 & 110,000 \\
Equipment & 50,000 & 60,000
\end{tabular}

Output:

<table>
<thead>
<tr>
<th></th>
<th>Year1</th>
<th>Year2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Travel</td>
<td>100,000</td>
<td>110,000</td>
</tr>
<tr>
<td>Equipment</td>
<td>50,000</td>
<td>60,000</td>
</tr>
</tbody>
</table>

4.6.3 Rules

In general, vertical rules are considered superfluous [11]. Although Tura-bian [17] allows for the possibility of vertical rules for tabulated material containing more than two columns but still advises against having too many and deprecates the use of them at either end.

Horizontal rules may be used at the top and bottom of the tabulated material, but other horizontal rules should be kept to a minimum. In general, the top and bottom rule should be thicker than the mid rules.

The booktabs package provides:

\texttt{\textbackslash toprule[(wd)]} 

for the top horizontal rule,

\texttt{\textbackslash bottomrule[(wd)]} 

Definition
for the bottom horizontal rule, and

$$\text{\texttt{\textbackslash midrule[\langle wd\rangle]}}$$

for horizontal rules in between rows, such as after the header row.

These commands should all go at the start of the appropriate row. This means that if you want a bottom rule, you need to add \ \ \ followed by \ \texttt{\textbackslash bottomrule} at the end of the tabulated material.

**EXAMPLE:**

\begin{tabular}{lrr}
\toprule
\multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2} \\
\midrule
Travel & 100,000 & 110,000 \\
Equipment & 50,000 & 60,000 \\
\bottomrule
\end{tabular}

results in:

<table>
<thead>
<tr>
<th>Year1</th>
<th>Year2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Travel</td>
<td>100,000</td>
</tr>
<tr>
<td>Equipment</td>
<td>50,000</td>
</tr>
</tbody>
</table>

The thickness of the top and bottom rule is given by the \texttt{length} register \texttt{\textbackslash heavyrulewidth}, and the thickness of the mid rule is given by the \texttt{length} register \texttt{\textbackslash lightrulewidth}. These rule thicknesses can be overridden using the optional argument \langle \texttt{wd} \rangle for \texttt{\textbackslash toprule}, \texttt{\textbackslash midrule} and \texttt{\textbackslash bottomrule}.

**Exercise 7 (Aligning Material)**

Go back to the document you created in Exercise 2 (and later modified in Exercise 3), and add the following:

\begin{tabular}{lrr}
\textbf{Expenditure (£)} & Year1 & Year2 \\
\hline
Travel | 100,000 & 110,000 |
| Equipment | 50,000 | 60,000 |

Note that the \texttt{tabular} environment doesn’t create a caption, all it does is arrange its contents in rows and columns. You can find out how to turn your \texttt{tabular} environment into a table in Section 7.2.

You can download or view the solution to this exercise. (Remember to check Appendix B (Common Errors) if you encounter an error message.)
For more information about using the tabular environment see \texttt{\LaTeX}: A Document Preparation System [9], A Guide to \texttt{\LaTeX} [7] or The \texttt{\LaTeX} Companion [3]. The \texttt{\LaTeX} Companion also describes how to span rows using the multirow package. For information on how to create coloured tables using the colorbl package, see The \texttt{\LaTeX} Graphics Companion [5].

\section*{4.7 Boxes and Mini-Pages}
\texttt{\LaTeX} views everything on a page as a form of box. Each box has an associated width, height and depth, and the boxes are placed together on the page with glue. This is reminiscent of the days of manual typesetting, where each letter or symbol was on a wooden block, and the wooden blocks were glued in place. The simplest form of box is a single letter. Some letters, such as “a” only have a height and width, whereas other letters, such as “y” have a height, width and depth (see Figure 4.3).

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{figure43.png}
\caption{\texttt{\LaTeX} Views Each Letter as a Box}
\end{figure}

For example, the phrase “cabbages and peas” is made up of 15 boxes:
\begin{quote}
\texttt{cabbages and peas}
\end{quote}

whereas the word “cauliflower” consists of 10 boxes.\footnote{\texttt{\LaTeX} views each letter as a single character, and so is one box not two.}
More complicated boxes are made up of smaller boxes. We have already encountered one of these more complicated boxes: the \texttt{tabular} environment, discussed in the previous section. This type of box is called a horizontal box, which means that it can go in a line of text. For example:

\begin{verbatim}
Here is some text. \begin{tabular}{cc}
A & B \\
C & D
\end{tabular}
The rest of the line.
\end{verbatim}

produces:

\begin{verbatim}
Here is some text. A B C D The rest of the line.
\end{verbatim}

Recall from the previous section that the \texttt{tabular} environment had an optional argument \texttt{⟨pos⟩}. This governs the vertical alignment when the \texttt{tabular} environment occurs within a line of text. This can be one of \texttt{c} (centred — the default, as illustrated above), \texttt{t} (top) and \texttt{b} (bottom). For example,

\begin{verbatim}
Here is some text. \begin{tabular}\[b\]{cc}
A & B \\
C & D
\end{tabular}
The rest of the line.
\end{verbatim}

produces:

\begin{verbatim}
A B C D The rest of the line.
\end{verbatim}

Since a box can’t be broken across a line of text, you can use the box making command:

\begin{verbatim}
\mbox\{⟨text⟩\}
\end{verbatim}

definition

to prevent \texttt{⟨text⟩} from spanning a line break.

\textbf{Example:}

Compare:
\texttt{\raggedright Some text at the beginning of a paragraph. Some text in the middle of the paragraph. Some more text. \par}

\texttt{\raggedright Some text at the beginning of a paragraph. Some text in the middle of the paragraph. Some more text.}

with:

\begin{verbatim}
\texttt{\raggedright Some text at the beginning of a paragraph. \mbox{Some text in the middle of the paragraph.} Some more text. \par}
\end{verbatim}

\texttt{Some text at the beginning of a paragraph. Some text in the middle of the paragraph. Some more text.}

(If \texttt{\raggedright} had not been used, the text in the \texttt{\mbox} would’ve spilt out over the edge of the page.)

Another type of box which can again be placed in a line of text, is the \texttt{minipage} environment.

\begin{verbatim}
\texttt{\begin{minipage}{⟨pos⟩}[⟨height⟩]{⟨width⟩}}
\end{verbatim}

As the name suggests, this environment creates a “mini-page” of the given width.

\textbf{Example:}

\begin{verbatim}
Some text. \begin{minipage}{2in} This is a mini-page. The text inside it is formatted as usual. \end{minipage}
\end{verbatim}

Paragraph breaks can also be used, but there is no indentation by default\texttt{\footnote{and this is how a footnote appears}}.

\begin{verbatim}
\end{minipage}
\end{verbatim}

The rest of the line.

which produces:
Some text. This is a mini-page. The text inside it is formatted as usual. Paragraph breaks can also be used, but there is no indentation by default. \footnote{and this is how a footnote appears.}

You can optionally specify a height, and how the mini-page is aligned with the rest of the text. As with the \texttt{tabular} environment, the alignment option (pos) can be one of t (top), c (centred) or b (bottom). The default is c, which is why the above example has the mini-page centred vertically. This can be changed, for example:

\begin{minipage}[t]{2in}
This is a mini-page. The text inside it is formatted as usual. Paragraph breaks can also be used, but there is no indentation by default. \footnote{and this is how a footnote appears.}
\end{minipage}

which produces

Note that the width can be specified relative to the current line width, using the \texttt{length} register \texttt{\linewidth}. For example,

\begin{minipage}{0.5\linewidth}
will start a mini-page that is half the width of the current line.

There is also a corresponding command

\parbox[\langle pos\rangle][\langle height\rangle][\langle width\rangle]{\langle text\rangle}

which behaves in a similar way. So the above example can be rewritten using a \texttt{\parbox}:
Some text. \parbox[t]{2in}{This is a parbox. The text inside it is formatted as usual.

Paragraph breaks can also be used, but there is no indentation by default.}
The rest of the line.

which produces

\begin{verbatim}
Some text. This is a parbox. The text
inside it is formatted as usual.
Paragraph breaks can also be used, but there is
no indentation by default.
\end{verbatim}

You may have noticed that the \footnote command has not been used in the above example. The \parbox command is more restricted than the minipage environment, so you can’t use the \footnote command in it. There are also certain environments, such as the list-making environments described in Section 4.4, that can be used in a minipage but not in a \parbox.

\section*{4.7.1 Framed Boxes}

Recall the \framebox command described in Section 2.8.2:

\framebox[(width)]{(text)}

This treats \texttt{(text)} as a box of width \texttt{(width)} and puts a frame around it. The second optional argument may be one of: \texttt{c} (centred contents), \texttt{l} (left-aligned contents), \texttt{r} (right-aligned contents).

\textbf{EXAMPLE:}

Some \framebox[2in]{framed} text.

Some \fbox{framed} text.

There is a shorter related command with no optional arguments:

\fbox{(text)}

The fancybox package provides some additional framing commands:

\shadowbox{(text)}

Puts a shadow-style frame around its contents:

Some \shadowbox{framed} text.
\doublebox{⟨text⟩}

Definition

Puts a double-lined frame around its contents:

Some \doublebox{framed} text.

Some \textbf{framed} text.

\ovalbox{⟨text⟩}

Definition

Puts a thin-lined oval frame around its contents:

Some \ovalbox{framed} text.

Some \textbf{framed} text.

\Ovalbox{⟨text⟩}

Definition

Puts a thick-lined oval frame around its contents:

Some \Ovalbox{framed} text.

Some \textbf{framed} text.

If you want a different frame effect, you will need to use a graphical package, such as \texttt{pgf/tikz}.

\textbf{EXAMPLE:}

This example uses commands beyond the scope of this book, but gives you an idea of what's possible.

\begin{verbatim}
\documentclass{scrartcl}
\usepackage{tikz}
\usetikzlibrary{shapes}
\usetikzlibrary{decorations.pathmorphing}
\begin{document}
Some \begin{tikzpicture}[baseline=(n.base),decoration=bumps]
\node[draw,ellipse,decorate] (n) {framed};
\end{tikzpicture}
text.
\end{document}
\end{verbatim}

For further details, see the \texttt{pgf documentation}.\footnote{Input}

CHAPTER 5

STRUCTURING YOUR DOCUMENT

Let's go back to the document we modified in Exercise 7. In this chapter we shall edit that document step by step until we have a fully-fledged document with title, abstract, table of contents, sections etc.

5.1 Author and Title Information

The term title page is used to indicate the author, title and date information that can appear either on the front cover by itself or along the top of the first page of text. In order to do this, you must first specify the information. Once this information has been specified it can then be displayed.

The author, title and date are entered using the commands:

\author{⟨author names⟩}
\title{⟨title text⟩}
\date{⟨document date⟩}

The KOMA-Script classes also define:

\titlehead{⟨Title heading⟩}
\subject{⟨Subject⟩}
\subtitle{⟨Subtitle⟩}
\publishers{⟨Publisher⟩}

All these title-related commands only store information, they don't actually display anything. These commands can be put in the preamble. With most classes, you will typically need to use at least \author and \title.

Once you have used these commands, you can then display the information using the command:

\maketitle

This command should be placed where you want the title page to appear, which is normally at the start of the document environment.

Note that if you don't use the \date command, the current date will be inserted. If you want no date to appear, you need to specify an empty argument:

\date{}

Multiple authors should be separated by the command \and. For example:
Exercise 8 (Creating Title Pages)

Try editing the document you modified in Exercise 7 to include title information. Modifications are illustrated in bold like this:

```latex
\documentclass[12pt]{scrartcl}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\begin{tabular}{lrr}
& \multicolumn{2}{c}{\bfseries Expenditure}\\
& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2}\\
\bfseries Travel & 100,000 & 110,000\\
\bfseries Equipment & 50,000 & 60,000
\end{tabular}
\end{document}
```
5.2 Abstract

The \texttt{abstract} environment is used to create an abstract for the document. The way in which the abstract is formatted depends on the class file. The \texttt{scrreprt} class file will put the abstract on a page by itself, some class files will indent the abstract and some will typeset the abstract in italic. Note also that some class files (such as \texttt{scrbook}) don’t have an \texttt{abstract} environment. Abstracts traditionally go at the start of the document after the title, so the \texttt{abstract} environment should go after the \texttt{\maketitle} command.

**Exercise 9 (Creating an Abstract)**

Try editing your document so that it has an abstract: Modifications are illustrated like this:

```latex
\documentclass[12pt]{scrartcl}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\begin{abstract}
A brief document to illustrate how to use \LaTeX.\n\end{abstract}
\end{document}
```

This is a simple \LaTeX\ document.
Here is the first paragraph.
Here is the second paragraph\footnote{with a footnote}. As you can see it’s a rather short paragraph, but not as short as the previous one. This document was created on: \today\ at \currenttime.

\begin{tabular}{lrr}
& \multicolumn{2}{c}{\textbf{Expenditure}}\\
& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2}\\
\textbf{Travel} & 100,000 & 110,000\\
\end{tabular}
You can download this document.

5.3 Chapters, Sections, Subsections ...

Chapters, sections, subsections etc can be inserted using the commands:

```latex
\part{⟨short title⟩}{⟨title⟩}
\chapter{⟨short title⟩}{⟨title⟩}
\section{⟨short title⟩}{⟨title⟩}
\subsection{⟨short title⟩}{⟨title⟩}
\subsubsection{⟨short title⟩}{⟨title⟩}
\paragraph{⟨short title⟩}{⟨title⟩}
\subparagraph{⟨short title⟩}{⟨title⟩}
```

All these commands have a moving argument \langle title \rangle and an optional argument \langle short title \rangle. The mandatory argument \langle title \rangle is simply the title of the chapter/section/subsection etc. For example:

```latex
\section{Introduction}
```

If you are using the scrartcl class file, the output will look like:

1 Introduction

Note that you don’t specify the section number as \LaTeX\ does this automatically. This means that you can insert a new section or chapter or swap sections around or even change a section to a subsection etc, without having to worry about updating all the section numbers.

If you are using a class file that contains chapters as well as sections, the section number will depend on the chapter. So, for example, the current section is the 3\textsuperscript{rd} section of chapter 5, so the section number is 5.3. (Note that if you are using a class file where the section number depends on the chapter number, you must have a \chapter command before your first

\section command, otherwise your section numbers will come out as 0.1, 0.2 etc.

Unnumbered chapters/sections etc are produced by placing an asterisk * after the command name. For example:

\chapter*{Acknowledgements}

You can switch to appendices using the command

\appendix

then continue using \chapter, \section etc. For example (using the scrreprt class file):

\appendix
\chapter{Derivations}
Some derivations.

\chapter{Tables}
Some tables.

Note:
The KOMA-Script classes have another type of sectioning command:

\minisec{⟨heading⟩}

This provides an unnumbered heading not associated with any of the structuring levels. For example, the above was produce using:

\minisec{Note:}
The KOMA-Script classes have another type of sectioning command:

The next note below was produced using:

\minisec{Important Note:}
If you want to change the font style used by headings, \textbf{do not} use font declarations in the sectioning command arguments.

Important Note:
If you want to change the font style used by headings, \textbf{do not} use font declarations in the sectioning command arguments. Don’t do, for example:

\chapter{\textit{Introduction}}
The KOMA-Script classes provide the command:

```latex
\addtokomafont{⟨element⟩}{⟨commands⟩}
```

where ⟨element⟩ is the name of a structuring element (no backslash) and ⟨commands⟩ is the list of font changing declarations (see Table 4.6) to apply to that element style. For example, this book uses the commands:

```latex
\addtokomafont{section}{\rmfamily\bfseries}
\addtokomafont{minisec}{\rmfamily\bfseries\scshape}
```

### Exercise 10 (Creating Chapters, Sections etc)

Let’s try editing our document so that it now has chapters, sections and an appendix. Since the `scrartcl` class file doesn’t have chapters, let’s change to the `scrreprt` class. Changes from our previous document are shown like this.

```latex
\documentclass[12pt]{scrreprt}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\begin{abstract}
A brief document to illustrate how to use \LaTeX.
\end{abstract}
\chapter{Introduction}
\section{The First Section}
This is a simple \LaTeX\, document.
Here is the first paragraph.
\section{The Next Section}
Here is the second paragraph\footnote{with a footnote}.
As you can see it’s a rather short paragraph, but not as short as the previous one. This document was created on: \today\, at \currenttime.
\chapter{Another Chapter}
```
Here’s another very interesting chapter.
We’re going to put a picture here later.

\chapter*{Acknowledgements}

I would like to acknowledge all those very helpful people who have assisted me in my work.

\appendix

\chapter{Tables}
We will turn this tabular environment into a table later.

\begin{tabular}{lrr}
& \multicolumn{2}{c}{\bfseries Expenditure}\\
& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2}\\
\bfseries Travel & 100,000 & 110,000\\
\bfseries Equipment & 50,000 & 60,000
\end{tabular}

5.4 Creating a Table of Contents

Once you have all your sectioning commands, such as \chapter and \section, you can create a table of contents with the command

\tableofcontents

This command should go where you want your table of contents to appear (usually after \maketitle). The KOMA-Script classes provide two options that govern the format of the table of contents: toc=graduated and toc=flat. The first is the default and indents the different sectioning levels. The second doesn’t use any indentation.

**EXAMPLE:**

\documentclass[12pt, toc=flat]{scrreprt}

You may recall from the previous section that the sectioning commands all had an optional argument \texttt{⟨short title⟩}. If your chapter or section title is particularly long, you can use \texttt{⟨short title⟩} to specify a shorter title that should go in the table of contents.\footnote{The longer title (given by the other and in the page header, depending on the page style.}
argument \langle title \rangle) will still appear in the section heading in the main part of the document.

\LaTeX processes all source code sequentially, so when it first encounters the \texttt{\tableofcontents} command, it doesn’t yet know anything about the chapters, sections etc. So the first time the document is \LaTeX\ed the necessary information is written to the table of contents (.toc) file (see Section 2.4). The subsequent pass reads the information in from the .toc file, and generates the table of contents. You will therefore need to \LaTeX\ your document twice to make sure that the table of contents is up-to-date.

**ADDING EXTRA INFORMATION**

The starred versions of the sectional commands (such as \texttt{chapter*}) don’t get added to the table of contents. It may be that you want to add it, in which case you need to use

\begin{verbatim}
\addcontentsline{\toc}{\section}{\textit{text}}
\end{verbatim}

after the heading. The first argument \langle toc \rangle is the file extension without the dot. As mentioned above, the table of contents file has the extension .toc, so the first argument should be toc \texttt{(}later in Chapter 7 (Floats), we’ll be adding a list of figures and a list of tables, and those have file extensions .lof and .lot, respectively\texttt{)}. The second argument \langle section unit \rangle is the name of the section unit. This is just the name of the relevant sectioning command without the backslash. The final argument \langle text \rangle is the entry text. For example (using \texttt{scrreprt} class):

\begin{verbatim}
\chapter*{Acknowledgments}
\addcontentsline{toc}{chapter}{Acknowledgements}
\end{verbatim}

Exercise 11 (Creating a Table of Contents)

Try modifying your document so that it has a table of contents. Modifications from the previous exercise are illustrated like this:

\begin{verbatim}
\documentclass[12pt]{scrreprt}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\tableofcontents
\end{document}
\end{verbatim}
A brief document to illustrate how to use \LaTeX. 

This is a simple \LaTeX document. Here is the first paragraph.

Here is the second paragraph with a footnote. As you can see it's a rather short paragraph, but not as short as the previous one. This document was created on: $\today$ at $\currenttime$.

Here’s another very interesting chapter. We’re going to put a picture here later.

I would like to acknowledge all those very helpful people who have assisted me in my work.

We will turn this tabular environment into a table later.

\begin{tabular}{lrr} 
& \multicolumn{2}{c}{\bfseries Expenditure}\\ 
& \multicolumn{1}{c}{\bfseries Year1} & \multicolumn{1}{c}{\bfseries Year2}\\ 
\bfseries Travel & 100,000 & 110,000\\ 
\bfseries Equipment & 50,000 & 60,000\\ 
\end{tabular} 

If your table of contents doesn't come out right, try \LaTeXing it again. (Again, you can download this file.) You might want to try experimenting with the tocbreak class options to see what difference it makes:
5.5 Cross-Referencing

We have already seen that \LaTeX{} takes care of all the numbering for the chapters etc, but what happens if you want to refer to a chapter or section? There’s no point leaving \LaTeX{} to automatically generate the section numbers if you have to keep track of them all, and change all your cross-references every time you add a new section. Fortunately \LaTeX{} provides a way to generate the correct number. All you have to do is label the part of the document you want to reference, and then refer to this label when you want to cross-reference it. \LaTeX{} will then determine the correct number that needs to be inserted at that point.

The first part, labelling the place you want to reference, is done using the command:

\begin{verbatim}
\label{⟨string⟩}
\end{verbatim}

The argument \texttt{⟨string⟩} should be a unique textual label. This label can be anything you like as long as it is unique, but it’s a good idea to make it something obvious so that, firstly, you can remember the label when you want to use it, and secondly, when you read through your code at some later date, it’s immediately apparent to you to which part of the document you are referring. People tend to have their own conventions for labelling. I usually start the label with two or three letters that signify what type of thing I’m labelling. For example, if I’m labelling a chapter I’ll start with \texttt{ch}, if I’m labelling a section I’ll start with \texttt{sec}.

\textbf{Examples:}

1. Labelling a chapter:

\begin{verbatim}
\chapter{Introduction}
\label{ch:intro}
\end{verbatim}

2. Labelling a section:

\begin{verbatim}
\section{Technical Details}
\label{sec:details}
\end{verbatim}
Note that the \texttt{\label} command doesn’t produce any text, it simply assigns a label. You can now refer to that object using the command:

\texttt{\ref{⟨string⟩}}

which will produce the relevant number.

\textbf{Example:}

See Section \texttt{\ref{sec:results}} for an analysis of the results.

It is a typographical convention that you should never start a new line with a number. For example, if you have the text “Chapter 1” the “1” must be on the same line as the “Chapter”. We can do this by using an \textit{unbreakable space}, which will put a space but won’t allow \texttt{\LaTeX} to break the line at that point. This is done using the tilde (~) \texttt{\textit{special character}}, so the example above should actually be:

See Section~\texttt{\ref{sec:results}} for an analysis of the results.

There is a similar command to reference the page number:

\texttt{\pageref{⟨string⟩}}

\textbf{Example:}

See Chapter~\texttt{\ref{ch:def}} on page~\texttt{\pageref{ch:def}} for a list of definitions.

The label \texttt{ch:def} obviously needs to be defined somewhere:

\texttt{\chapter{Definitions}}

\texttt{\label{ch:def}}

In fact, I have done this in my source code for \texttt{Chapter 2 (Some Definitions)} of this document, so the above example would look like:

See Chapter 2 on page 7 for a list of definitions.

It’s not just chapters and sections that you can reference, most of the numbers that \texttt{\LaTeX} automatically generates can be cross-referenced.

\textbf{Example:}

The source code for footnote \texttt{5.1} on page 85 is:

\texttt{\footnote{\label{ftn:header}and in the page header, depending on the page style}}

and it was referenced above using:

\texttt{\ref{ftn:header}}
The source code for footnote~\ref{ftn:header} on page~\pageref{ftn:header} is:

The \texttt{varhref} package provides a more convenient way of doing this using the command:

\vref{⟨label⟩}

This is like \ref but also adds information about the location, such as “on page ⟨n⟩” or “on the following page”, if the corresponding \label occurs on a different page, so the above example can be changed to:

The source code for footnote~\vref{ftn:header} is:

which still produces

The source code for footnote \ref{sec:edit} on page \pageref{sec:edit} is:

Compare with a reference to one of the labels in the next example:

See step~\vref{itm:edit}.

which produces:

See step 1 on the following page.

\textbf{Caveat:}

You can run into trouble if the \vref command occurs on a page break. When it tries to insert the location information, such as “on the next page”, the information is no longer correct. This can cause an “Infinite loop” error. When this happens, either edit your paragraph so the reference no longer falls on the page break or use \ref instead of \vref for that instance.

\textbf{Another Example:}

The \texttt{enumerate} environment described in Section 4.4.2 automatically numbers the items within an ordered list, so it’s possible to label list items. Recall the numbered list of instructions at the start of Chapter 3 (From Source Code to Typeset Output). Here’s the code:

\begin{enumerate}

\item\label{itm:edit} Write or edit the source code.

\item Pass the source code to the \texttt{latex} or \texttt{pdflatex} application (‘‘\LaTeX\␣the document’’).

\begin{itemize}

\item If there are any error messages, return to Step~\ref{itm:edit}.

\item If there are no error messages, a PDF file...
1. Write or edit the source code.

2. Pass the source code to the \texttt{latex} or \texttt{pdflatex} application ("\LaTeX\ the document").
   
   • If there are any error messages, return to Step 1.
   • If there are no error messages, a PDF file is created, go to Step 3.

3. View the PDF file to check the result.

The \texttt{ref} and \texttt{pageref} commands may come before or after the corresponding \texttt{label} command. As with the table of contents, \LaTeX\ first writes out all the cross-referencing information to another file (the auxiliary (.aux) file, see Section 2.4) and then reads it in the next time, so you will need to \LaTeX\ your document twice to get everything up-to-date.

   If the references aren’t up-to-date, you will see the following message at the end of the \LaTeX\ run:

   \LaTeX\ Warning: Label(s) may have changed.
   Rerun to get cross-references right.

The following warning

\LaTeX\ Warning: There were undefined references.

means that \LaTeX\ found a reference to a label that does not appear in the auxiliary file. This could mean that it’s a new label, and the warning will go away the next time you \LaTeX\ your document, or it could mean that either you’ve forgotten to define your label with the \texttt{label} command, or you’ve simply misspelt the label. The undefined references will show up as two question marks ?? in the output file.

Very occasionally, if you have cross-references and a table of contents, you might have to \LaTeX\ your document three times to get everything up to date. Just check to see if the Label(s) may have changed warning appears.

   If you find it inconvenient having to remember to click the typeset button twice, you can use \texttt{latexmk}. This will run \LaTeX\ the required number of times to ensure the document is up-to-date. To do this in TeXWorks, change the drop-down menu to \texttt{LaTeXmk}, as illustrated in Figure 5.1. Note that [FAQ: "Rerun" messages won't go away]
Figure 5.1 Selecting LaTeXmk in TeXWorks
latexmk is a Perl script, so you need to make sure you have perl installed (see Section 2.20).

If latexmk isn't listed in the drop-down menu, you can add it via Edit→Preferences. This opens the dialog box shown in Figure 5.2. You can add a new tool as follows:

1. To the right of the box labelled “Processing Tools” there is a button marked with a plus (+) sign. Click on it to open the tool configuration dialog, shown in Figure 5.3.

2. Fill in the name “LaTeXmk” in the box labelled “Name” and either type in the location of latexmk in the box labelled “Program” or use the “Browse” button to locate it on your filing system. (See Figure 5.4.) This will vary depending on your operating system and \TeX-distribution, but it will probably be in a subdirectory (folder) called bin somewhere in the \TeX-distribution tree.

3. There are lots of options that can be passed to latexmk, but if you want to produce PDF output you need to add \texttt{-pdf} as an argument. This is done by clicking on the button marked with a plus to the right of the “Arguments” box and type \texttt{-pdf}, as shown in Figure 5.5.

4. Another argument needs to be added that specifies the basename of the \LaTeX file. This is done by again clicking on the plus button and typing \texttt{$basename$}, as shown in Figure 5.6.

5. Click on “OK” to close the Tool Configuration dialog.

6. If you want to set latexmk to be your default processing tool, you can select it from the drop-down list labelled “Default”.

7. Click “OK” when you're done.

**Exercise 12 (Cross-Referencing)**

Try modifying your code so that it has cross-references. Again, changes made from the previous exercise are illustrated like this:

```latex
\documentclass[12pt]{scrreprt}
\usepackage{datetime}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
```

Figure 5.4 Tool Configuration Dialog: set the name and program location

Figure 5.5 Tool Configuration Dialog: adding -pdf argument

\tableofcontents

\begin{abstract}
A brief document to illustrate how to use \LaTeX.\end{abstract}

\chapter{Introduction}
\label{ch:intro}

\section{The First Section}
This is a simple \LaTeX\ document. Here is the first paragraph. The next chapter is Chapter~\ref{ch:another} and is on page~\pageref{ch:another}. The next section is Section~\ref{sec:next}.

\section{The Next Section}
\label{sec:next}

Here is the second paragraph\footnote{with a footnote}. As you can see it’s a rather short paragraph, but not as short as the previous one. This document was created on: \today at \currenttime.

\chapter{Another Chapter}
\label{ch:another}

Here’s another very interesting chapter. We’re going to put a picture here later.
See Chapter-\ref{ch:intro} for an introduction.

\chapter*{Acknowledgements}

I would like to acknowledge all those very helpful people who have assisted me in my work.

\appendix
\chapter{Tables}

We will turn this tabular environment into a table later.

\begin{tabular}{lrr}
& \multicolumn{2}{c}{\bfseries Expenditure} \\
& \multicolumn{1}{c}{Year1} & \multicolumn{1}{c}{Year2} \\
\bfseries Travel & 100,000 & 110,000 \\
\bfseries Equipment & 50,000 & 60,000
\end{tabular}

\end{document}

\begin{thebibliography}{⟨widest tag⟩}
\bibitem[⟨tag⟩]{⟨key⟩} Definition
\end{thebibliography}

\footnote{\textit{FAQ: Creating a \LaTeX \bibliography file}}

\section{5.6 Creating a Bibliography}

If you have a large number of citations in your document, it's best to use an external bibliographic application, such as bibtex or biber. However, that is beyond the scope of this book (see, instead, \textit{A Guide to \LaTeX} \[7\], \textit{The \LaTeX \Companion} \[3\] or \textit{Using \LaTeX to Write a PhD Thesis} \[13\]). Therefore this section just gives a brief explanation of the \texttt{thebibliography} environment, which is usually automatically generated using bibtex or biber.

\begin{thebibliography}{⟨widest tag⟩}
\bibitem[⟨tag⟩]{⟨key⟩} Definition
\end{thebibliography}

This environment is very similar to the list making environments described in Section 4.4, but instead of \texttt{\textbf{item}} use

\begin{verbatim}
\bibitem[⟨tag⟩]{⟨key⟩}
\end{verbatim}

where \texttt{⟨key⟩} is a unique keyword that identifies this item. Your keyword can be anything you like, but as with \texttt{\textbf{label}} I recommend that you use a short memorable keyword. I tend to use the first author's surname followed by the year of publication.
The bibliography heading depends on the class file you are using. Most of the article-style classes, such as \texttt{scrreprt}, use \texttt{\refname} (which produces "References") in an unnumbered section, whereas the report and book-styles, such as \texttt{scrreprt} and \texttt{scrbk}, use \texttt{\bibname} (which produces "Bibliography") in an unnumbered chapter. See Table \ref{tab:common-textual-labels} for the list of the common textual label commands.

Most class files don't automatically add the bibliography to the table of contents. The KOMA-Script classes provide the \texttt{bibliography} option. This can be bibliography=totoc (an unnumbered unit added to the table of contents), for example,

\texttt{\documentclass[bibliography=totoc]{scrreprt}}

or bibliography=totocnumbered (a numbered unit added to the table of contents), for example,

\texttt{\documentclass[bibliography=totocnumbered]{scrreprt}}

If you're not using one of the KOMA-Script classes, consult the documentation for your class to see if there is an equivalent option. Failing that, you can use \texttt{\addcontentsline} (described in Section \ref{sec:adding-sections}). For example (using a class that defines chapters):

\texttt{\addcontentsline{toc}{chapter}{\bibname}}

\begin{thebibliography}{3}
\bibitem{lamport94} "\LaTeX: a document preparation system", Leslie Lamport, 2nd edition (updated for \LaTeXe), Addison-Wesley (1994).
\bibitem{kopka95} "A Guide to \LaTeX: document preparation for beginners and advanced users", Helmut Kopka and Patrick W. Daly, Addison-Wesley (1995).
\bibitem{goossens94} "The \LaTeX\ Companion", Michel Goossens, Frank Mittelbach and Alexander Samarin, Addison-Wesley, (1994).
\end{thebibliography}

\footnote{If a friend or colleague gives you a file containing \texttt{\documentstyle} instead of \texttt{\documentclass} they are nearly 20 years out of date.}
Bibliography

You can cite an item in your bibliography with the command\cite{⟨key list⟩}

\textbf{Example}:

For more information about writing bibliographies see Goossens \textit{et al.}\cite{goossens94}.

Output:

For more information about writing bibliographies see Goossens \textit{et al.} [3].

If you want to cite multiple works, use a comma-separated list:

\textbf{Example}:

For more information about writing bibliographies see\cite{kopka95,goossens94}.

Output:

For more information about writing bibliographies see [2,3].

The \textit{optional argument} ⟨text⟩ to the \texttt{\cite} command can be used to add text to the citation.

\textbf{Example}:

For more information about writing bibliographies see Goossens \textit{et al.}\cite[Chapter-13]{goossens94}.

Output:
For more information about writing bibliographies see Goossens et al. [3, Chapter 13].

The `thebibliography` environment has a mandatory argument:

```latex
\begin{thebibliography}{⟨widest tag⟩}
```

The argument `⟨widest tag⟩` is the widest tag in the list of entries. This helps \LaTeX to align the references correctly. In the example above, the tags appeared as: [1], [2] and [3], and [3] is the widest so that was used as the argument. These tags can be changed from the default numbers to something else using the optional argument to the `\bibitem` command.

**Example (Textual Tags):**

This example uses the optional argument of `\bibitem` to use textual rather than numerical tags. The widest tag is [Goossens 1994] so that is chosen to be the argument of the `thebibliography` environment:

```latex
\begin{thebibliography}{Goossens 1994}
```

```
\bibitem[Lamport 1994]{lamport94} ''\LaTeX : a document preparation system'', Leslie Lamport, 2nd edition (updated for \LaTeXe), Addison-Wesley (1994).

\bibitem[Goossens 1994]{goossens94} ‘‘The \LaTeX Companion’’, Michel Goossens, Frank Mittelbach and Alexander Samarin, Addison-Wesley, (1994).
```

```latex
\end{thebibliography}
```

**Bibliography**

Exercise 13 (Creating a Bibliography)

Try adding the following chapter to your document:

```latex
\chapter{Recommended Reading}
```

For a basic introduction to \LaTeX\ see Lamport~\cite{lamport94}. For more detailed information about \LaTeX\ and associated applications, consult Kopka and Daly~\cite{kopka95} or Goossens \emph{et al}~\cite{goossens94}.

and also add the bibliography shown above to the end of your document. You can download or view the solution, but have a go by yourself first. Remember that, as before, you will need to \LaTeX\ the document twice to get the references up-to-date, unless you're using \verb|latexmk| (as described in Section 5.5) in which case it will be done automatically.

5.7 Page Styles and Page Numbering

You may have noticed that the documents you have created have all had their page numbers automatically inserted at the foot of most of the pages. If you have created the document that has gradually been modified over the previous few sections, you may have noticed that the title page has no header or footer, the table of contents starts on page 1, the abstract page has no page number, and the pages after the abstract start on page 1 and continue incrementally onwards from that point. All the page numbers are Arabic numerals. This can be changed using the command:

```
\pagenumbering{⟨style⟩}
```

where ⟨style⟩ can be one of:

- \texttt{arabic} Arabic numerals (1, 2, 3, …)
- \texttt{roman} Lower case Roman numerals (i, ii, iii, …)
- \texttt{Roman} Upper case Roman numerals (I, II, III, …)
- \texttt{alph} Lower case alphabetical characters (a, b, c, …)
- \texttt{Alph} Upper case alphabetical characters (A, B, C, …)

Traditionally, the front matter (table of contents, list of figures etc) should have lower case Roman numeral page numbering, while the main matter should be in Arabic numerals.
Example:

\author{Me}
\title{A Simple Document}
\maketitle
\pagenumbering{roman}
\tableofcontents
\begin{abstract}
This is the abstract.
\end{abstract}
\pagenumbering{arabic}
\chapter{Introduction}

The \texttt{scrbook} class provides:
\texttt{\frontmatter}
\texttt{\mainmatter}

which switches to lower case Roman numeral page numbering, and

\texttt{\backmatter}

which switches to Arabic numeral page numbering. These two declarations also change the way the sectioning units, such as \texttt{\chapter} and \texttt{\section}, appear. The former, \texttt{\frontmatter}, suppresses the numbering (regardless of whether or not you've used the starred version of the sectioning commands). The latter, \texttt{\mainmatter}, switches the numbering back on (unless otherwise suppressed by using the starred sectioning commands). In addition, \texttt{scrbook} provides

\texttt{\backmatter}

which doesn't affect the page numbering but, like \texttt{\frontmatter}, suppresses the sectional unit numbering.

\textbf{Note:}
The \texttt{abstract} environment isn't defined by the \texttt{scrbook} class, as a book summary is usually incorporated into an introductory section.

Example:

\documentclass[12pt]{scrbook}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\frontmatter
\tableofcontents
\chapter{Summary}
A brief document to illustrate how to use \LaTeX.
\mainmatter
\chapter{Introduction}
\label{ch:intro}
\end{document}

The headers and footers can be changed using the command
\pagestyle{⟨style⟩}
Individual pages can be changed using
\thispagestyle{⟨style⟩}
Standard styles are:
empty No header or footer.
plain Header empty, page number in footer.
headings Header contains page number and various information, footer empty.
myheadings Header specified by user, footer empty.

If the myheadings style is used, the header information can be specified using:
\markboth{⟨left head⟩}{⟨right head⟩}
if the twoside option has been passed to the class file (default for scrbook), or
\markright{⟨right head⟩}
if the oneside option has been passed to the class file (default for scrartcl and scrreprt).

The scrreprt class file uses the empty style for the title and abstract pages and plain for the first page of each new chapter. By default the remaining pages are also plain, but these can be changed using the \pagestyle command. The scrbook class defaults to the headings style instead of plain.
The KOMA-Script bundle provides a way to define new page styles, but that's beyond the scope of this introductory tutorial. See the KOMA-Script documentation for further details if you are interested.

This book mostly uses the headings page style and the scrbook class with the oneside option, so there is no difference between odd and even page headers, whereas the paperback version uses the twoside option, so the odd pages display the chapter number and title and the even pages display the current section header and title. The on-screen PDF version of this book uses a page style I defined myself that incorporates a navigation bar in the footer.

**Exercise 14 (Page Styles and Page Numbering)**

Try modifying your code so that it uses the scrbook class, `\frontmatter` and `\mainmatter`. Replace the abstract environment with an unnumbered chapter, as shown below. Again, changes made from the previous document are illustrated like this:

```latex
\documentclass[12pt]{scrbook}

\usepackage{datetime}
\pagestyle{headings}
\title{A Simple Document}
\author{Me}
\begin{document}
\maketitle
\frontmatter
\tableofcontents
\chapter{Summary}
A brief document to illustrate how to use \LaTeX.
\mainmatter
\chapter{Introduction}
\label{ch:intro}
\section{The First Section}
This is a simple \LaTeX document. Here is the first paragraph.
The next chapter is Chapter~\ref{ch:another}
```
5.8 Multi-Lingual Support: using the babel package

You may have noticed that the \tableofcontents and \chapter commands have produced English words like “Contents” and “Chapter”. If you are writing in another language, this is not appropriate. In this case, you can use the babel package, and specify which language you will be using, either as an option to the babel package, or as an option to the class file. If you are writing in more than one language, list all the languages that you will be using where the last named language is the default language. For example:

\usepackage[english,french]{babel}

or

\documentclass[english,french]{scrreprt}
\usepackage{babel}

You can then switch between the named languages either using the declaration:

\selectlanguage{⟨language⟩}

or the otherlanguage environment:

\begin{otherlanguage}{⟨language⟩}

These will affect all translations, including the date format and predefined names like “Chapter”. This also changes the hyphenation patterns. (See Section 2.14.)

If you only want to set a short section of text in a different language, without affecting the date format or predefined names, then you can either use the command:

\foreignlanguage{⟨language⟩}{⟨text⟩}

or the starred version of the otherlanguage environment:

\begin{otherlanguage*}{⟨language⟩}
You can test to see if a given language is currently selected using:
\[ \texttt{\textbackslash iflanguage\{}\langle \textit{language} \rangle\texttt{\{\langle true \textit{text} \rangle\{\langle false \textit{text} \rangle \}} \]

**EXAMPLE:**

\begin{verbatim}
\documentclass[UKenglish,USenglish,french]{scrartcl}
% french is the last named option, so that's the current language
\usepackage[T1]{fontenc}
\usepackage[utf8]{inputenc}
\usepackage{babel}

\begin{document}
Ce texte est en français. La date aujourd'hui est: \today.

\selectlanguage{USenglish}
This text is in US English. Today’s date is: \today.

\selectlanguage{UKenglish}
This text is in UK English. Today’s date is: \today.
\end{document}
\end{verbatim}

Result:

\begin{verbatim}
Ce texte est en français. La date aujourd'hui est: 25 septembre 2012.
This text is in US English. Today's date is: September 25, 2012.
This text is in UK English. Today's date is: 25th September 2012.
\end{verbatim}

**NOTE:**

If you are using the `french` option, the colon character (:) is made active (that is, it's turned into a special character) so if you are writing in French it's best not to use a colon in labels (so where I've used, say, `ch: def` you may need to change the colon to something else).
Chapter 6

The graphicx Package

It is possible to generate images using \LaTeX commands (See the pgf/tikz package or The \LaTeX Graphics Companion [5]) however most people find it easier to create a picture in some other application, and include that file into their \LaTeX document.

PDF\LaTeX can insert PDF, PNG and JPG image files into your document. If your image file is in a different format, you may be able to find an application to convert it. Modern \TeX-distributions can automatically convert EPS files to PDF during the \LaTeX run using the Perl script epstopdf. If your \TeX-distribution doesn’t support this, you can convert your EPS file using epstopdf explicitly. For example, if you have an EPS image called, say, sample-image.eps, you can convert it to a PDF image called sample-image.pdf, by using the following command in a terminal or command prompt:

epstopdf sample-image.eps

or (full path name may be required)

perl epstopdf sample-image.eps

To insert an image file into your document, you first need to specify that you want to use the graphicx package. So the following must go in the preamble:

\usepackage{graphicx}

The image can then be included in your document using the command

\includegraphics[(key-val options)]{filename}

where \langle filename \rangle is the name of your image file without the file extension, and \langle key-val options \rangle is a comma-separated list of options that can be used to change the way the image is displayed. Note that if you have an image where the file name contain spaces or multiple dots, you need to use the grffile package:

\usepackage{graphicx,grffile}

Example:

Suppose you had a file called shapes.pdf, then to include it in your document you would do:

\includegraphics{shapes}

which would produce:
You can specify a full or relative pathname, but you must use a forward slash `/` as the directory divider, even if you are using Windows. For example:

```
\includegraphics{pictures/shapes}
```

means the file `pictures/shapes.pdf` on Unix-type systems, and it means the file `pictures\shapes.pdf` on Windows. This is mainly because the backslash character is a \LaTeX{} special character indicating a command, but it also helps portability between platforms.

You can specify the order of the file types to look for with the command

```
\DeclareGraphicsExtensions{⟨ext-list⟩}
```

where `⟨ext-list⟩` is a comma-separated list of extensions. For example, you might want to search first for PDF files, then for PNG files, then for JPG files and finally for EPS files:

```
\DeclareGraphicsExtensions{.pdf,.png,.jpg,.eps}
```

The default for PDF\LaTeX{} is:

`.png,.pdf,.jpg,.mps,.jpeg,.jbig2,.jb2,.PNG,.PDF,.JPG,.JPEG,.JBIG2,.JB2,.eps`

The optional argument `⟨key=⟨value⟩⟩` should be a comma-separated list of `⟨key⟩=⟨value⟩` pairs. Common options are:

- `angle=⟨x⟩` rotate the image by `x°` anticlockwise.
- `width=⟨length⟩` scale the image so that the width is `⟨length⟩`. (Remember to specify the `units`.)
- `height=⟨length⟩` scale the image so that the height is `⟨length⟩`. (Remember to specify the `units`.)
- `scale=⟨value⟩` Scale the image by `⟨value⟩`
- `trim=⟨l⟩⟨b⟩⟨r⟩⟨t⟩` Specifies the amount to remove from each side. For example

```
\includegraphics[trim=1 2 3 4]{shapes}
```

crops the image by 1bp from the left, 2bp from the bottom, 3bp from the right and 4bp from the top. (Recall the bp unit from Table 2.1.)

\footnote{``\textsuperscript{6.1}'' Or shapes.png or shapes.jpg or shapes.eps. The example assumes a PDF image file.}
This example first rotates the image by $45^\circ$ anticlockwise, then scales it so that the width is 1 inch.

\includegraphics[angle=45,width=1in]{shapes}

Note that this isn’t the same as scaling and then rotating:

\includegraphics[width=1in,angle=45]{shapes}

You can also scale an image relative to the text area using the \textwidth and \textheight registers. For example, to scale a portrait image so that its height is three-quarters of the text area height, you can do:

\includegraphics[height=0.75\textheight]{shapes}

or to scale a landscape image so that its width is half the text area width, you can do:

\includegraphics[height=0.5\textwidth]{shapes}

Note:
The \includegraphics command is another form of box (see Section 4.7), and can be used in the middle of a line of text, just like the tabular environment. See Section 7.1 to find out how to put the image in a figure with a caption.

Example:
Recall the ex unit of measure from Table 2.1. This can be used to scale an image relative to the font size:

\begin{verbatim}
An image can be inserted into a line of text like this: \includegraphics[height=2ex]{shapes}
\end{verbatim}

An image can be inserted into a line of text like this: 🌼
6.1 Graphical Transformations

The graphicx package also provides commands to rotate, resize, reflect and scale text. They are as follows:

\rotatebox{(option list)\{angle\}\{text\}}

Rotates \text{(text)} by \text{\{angle\}} (degrees anti-clockwise by default). The optional argument \text{(option list)} is a comma-separated list of any of the following options:

- \text{units=\{number\}}
  
  The number of units in one full anti-clockwise rotation. So \text{units=-360} means that \text{\{angle\}} specifies degrees clockwise whereas \text{units=6.283185} means that \text{\{angle\}} is in radians.

- \text{origin=\{label\}}
  
  The point of rotation. The value \text{\{label\}} may contain one from either or both of the two lists: \text{lrc} (left, right, centre) and \text{tbB} (top, bottom, baseline). Alternatively the origin may be specified using the following two keys:

  - \text{x=\{dimen\}}
  
  - \text{y=\{dimen\}}

\text{Example:}

\begin{verbatim}
base line  \rotatebox{45}{Some text} \rotatebox[units=-360]{45}{Some text} \rotatebox[units=-360,origin=rB]{45}{Some text} \rotatebox[x=3em,y=3em]{45}{Some text}
\end{verbatim}

\begin{verbatim}
base line  Some text Some text Some text Some text base line
\end{verbatim}

\text{\scalebox{\{h scale\}\{v scale\}\{text\}}}

Scales \text{(text)} by \text{\{h scale\}} in both directions if \text{\{v scale\}} omitted, otherwise scales \text{(text)} by \text{\{h scale\}} horizontally and \text{\{v scale\}} vertically.
EXAMPLE:
\texttt{\scalebox{0.8}{Some text}}  
_{Input}

Some text  
_{Output}

Compare with:
\texttt{\scalebox{0.8}[1.2]{Some text}}  
_{Input}

Some text  
_{Output}

\texttt{\reflectbox{(text)}}  
_{Definition}

Reflects \texttt{(text)} (equivalent to \texttt{\scalebox{-1}[1]{(text)}}).

EXAMPLE:
\texttt{\reflectbox{Some text}}  
_{Input}

\texttt{metadata}  
_{Output}

\texttt{\resizebox{\textwidth}{\height}{(text)}}  
_{Definition}

Scales \texttt{(text)} so that it is \texttt{\textwidth} wide and \texttt{\height} high. To preserve the aspect ratio, use \texttt{!} instead of one of the dimensions.

EXAMPLE:
\texttt{\resizebox{12mm}{\textwidth}{Some text}}  
\texttt{\resizebox{!}{\textwidth}{Some text}}  
_{\textwidth}

Some text Some text  
_{\textwidth}

\-section{6.2 Package Options}

The graphicx package can have the following options passed to it:

draft Don't actually display the images, just print the filename in a box of the correct size. This is useful if you want to print out a draft copy of a document to check the text rather than the images.

final Opposite of draft (default).

hiderotate Don't show rotated text.

hidescale Don't show scaled text.

Remember that relevant options passed to the class file also affect packages.
Example (Draft Mode):
Draft mode helps to speed up compilation of a large document when you are editing the text. In the preamble:

```
\usepackage[draft]{graphicx}
```

or

```
\documentclass[draft]{scrbook}
\usepackage{graphicx}
```

Later in the document:

```
\includegraphics[width=1in,angle=45]{pictures/shapes}
```

Exercise 15 (Using the graphicx Package)

Download the image file shapes.pdf from http://www.dickimaw-books.com/latex/novices/html/exercises/ (or create your own image), and include it into your document. (You can download or view an example solution.)

For more information on the graphicx package see The \LaTeX\ Graphics Companion [5] or the graphicx documentation.

Floats

Figures and tables are referred to as “floats” because they are floated to the nearest location. This prevents ugly large spaces appearing on the page if there isn’t enough room for the figure or table before the page break. Floats have a caption and associated number. It is customary for captions to appear at the bottom of figures but at the top of tables [17, 11].

For both figures and tables, the caption is generated using the command:

```
\caption{⟨short caption⟩}{⟨text⟩}
```

Note that the `\caption` command has a moving argument, so fragile commands will need to be protected using `\protect`. The optional argument `⟨short caption⟩` is used to provide an alternative shorter caption for the list of figures or list of tables, akin to the optional argument to the sectioning commands described in Section 5.3.

**Note:** Although the `\caption` command can have an optional short title, in general, captions should be brief. They should not contain lots of description or background detail [17]. That type of information should be placed in the main text not the caption.

**Positioning:**
Both the `figure` and `table` environments have an optional argument `⟨placement specifiers⟩`, which indicates permissible locations for the float. This may be a combination of h ("here"), t (top), b (bottom) and p (page of floats.) Note that this only gives a general guideline as to where the float will end up. The final location is governed by other factors, such as space left on the page and the proportion of text to floats on the page. If you omit one or more of the placement specifiers, then you are prohibiting the float from being placed in that location. A common mistake is to do

```
\begin{figure}[h]
```

which says “I want the figure here and it can’t go anywhere else!” If the figure can’t be placed exactly here (for example, there may not be enough room on the page), then you have given it no alternative location, which can result in this and all subsequent figures being dumped at the end of the chapter or document, or can result in a fatal error when running \LaTeX. You may be able to manage with only one of the other options, for example,

```
\begin{figure}[t]
```
(In fact, modern \TeX distributions now replace \texttt{[h]} with \texttt{[t]} if the float can't be placed.) However, if you have a large number of floats it is advisable to provide as many options as possible:

\begin{figure} [htbp]
\end{figure}

Similarly for tables.

If you are absolutely adamant that an image must go “right here”, then it’s not a float, and you shouldn’t be using the \texttt{figure} environment. It’s just a horizontal box, like the example on page \texttt{109}. Similarly for tabulated material.

It’s worth bearing in mind what the Oxford Style Manual \cite{11} has to say:

“Text must not be read into it so as to give \texttt{[the figure]} an explicit and fixed introduction, for example ‘in the following figure’: the final placement is determined by page breaks, which cannot be anticipated before setting, and this makes rewording the text necessary if the illustration does not fit the make-up of the page.”

Turabian \cite{17} gives the same advice (and reiterates it for figures):

“All text references to a table should be by a number, not by an introductory phrase such as ‘in the following table’.”

### 7.1 Figures

Figures are created using the \texttt{figure} environment.

\begin{figure} [htbp]
\end{figure}

This environment may contain one or more captions (specified, as described above, with the \texttt{caption} command) but page breaks are not allowed in the contents of a \texttt{figure} environment. The optional argument \texttt{⟨placement specifiers⟩} is as described above.

Recall from Chapter 6 (The graphicx Package) that we can include an image in our document with the command \texttt{\protect\includegraphics} defined in the graphicx package. We can put our \texttt{shapes.pdf} image into a figure as follows:

\begin{figure}[htbp]
\includegraphics{shapes}
\caption{Some Shapes}
\end{figure}

So far so good, but our picture needs to be centred. This can be done using the \texttt{\centering} declaration mentioned in Section 2.12:

\begin{figure}[htbp]
\centering
\end{figure}
The `\caption` command generates a number, just like `\section`, so we can cross-reference it with `\ref` and `\label`. First, let’s label the figure:

\begin{figure}[htbp]
  \centering
  \includegraphics{shapes}
  \caption{Some Shapes}
  \label{fig:shapes}
\end{figure}

Now we can reference it:

Figure ~\ref{fig:shapes} shows some shapes.

(As before we use ~ to make an unbreakable space.) This produces the following output in the text:

Figure 7.1 shows some shapes.

and produces Figure 7.1.

**Important Note:**
If you want to change the caption font, don’t do, e.g.:

\caption{\bfseries Some Shapes}

Recall \addtokomafont from Section 5.3. This can also be used to change the fonts used by the caption.

\addtokomafont{caption}{\bfseries}

Similarly for the caption label. For example:

\addtokomafont{captionlabel}{\scshape}
List of Figures
Just as we were able to generate a table of contents using `\tableofcontents`, we can also generate a list of figures using the command

`\listoffigures`

This creates a file with the extension `.lof` (see Section 2.4). As with `\tableofcontents` you will need to \LaTeX\ your document twice to get the list of figures up-to-date, unless you’re using `latexmk` (as described in Section 5.5) in which case it will be done automatically.

Exercise 16 (Creating Figures)

If you did Exercise 15, you should have a document with an image in it. You now need to put this image into a `figure` environment. Remember to centre the image, and give the figure a caption. Next, try labelling the figure and referencing it in the text. You could also put in a list of figures after the table of contents. You can download or view an example.

7.1.1 Side-By-Side Figures
Recall at the start of Section 7.1, I mentioned that the `figure` environment may contain one or more captions. In most cases, you’ll just have a single caption per `figure` environment, but sometimes you may want to have two figures side-by-side, in which case you’ll need two captions within the same `figure` environment in order to keep the figures together.

To do this, we can use the `minipage` environment, which was covered in Section 4.7. Recall that the minipage environment creates a horizontal box, which means that two mini-pages can be placed side-by-side on the same line. All you need to do now, is place one image and caption in one minipage, and the other image and caption in the neighbouring mini-page. (Do you remember what effect is obtained by placing a percent symbol at the end of a line?)

\begin{figure}[htbp]
\begin{minipage}{0.5\linewidth}
\centering
\includegraphics{circle}
\caption{A Circle}
\label{fig:circle}
\end{minipage}\
\begin{minipage}{0.5\linewidth}
\centering
\includegraphics{rectangle}
\caption{A Rectangle}
\label{fig:rectangle}
\end{minipage}\
\end{figure}
The above code produces Figures 7.2 and 7.3. Note that each mini-page uses \centering to centre its contents, and the label is also placed in the same mini-page, after the \caption command. If the \label was not in the same scope as the \caption, the cross-reference would be incorrect.

A common mistake when trying to create side-by-side figures is to do:

\begin{figure}[htbp]
\begin{minipage}{0.5\linewidth}
\centering
\includegraphics{circle}
\caption{A Circle}
\label{fig:circle}
\end{minipage}
\begin{minipage}{0.5\linewidth}
\centering
\includegraphics{rectangle}
\caption{A Rectangle}
\label{fig:rectangle}
\end{minipage}
\end{figure}

This produces one figure on top of the other, instead of side-by-side. This is because the blank line indicates a paragraph break, so each minipage is in a separate paragraph, so it’s not possible for them to be on the same line.

If you want a bit of spacing in your code to make it more readable, use % to comment out the paragraph break. For example:

\begin{minipage}{0.5\linewidth}
\centering
\includegraphics{circle}
\caption{A Circle}
\label{fig:circle}
\end{minipage}
% \begin{minipage}{0.5\linewidth}
\centering
\includegraphics{rectangle}
\caption{A Rectangle}
\label{fig:rectangle}
\end{minipage}

\begin{figure}
\centering
\includegraphics{circle}
\caption{A Circle}
\label{fig:circle}
\end{figure}

\begin{figure}
\centering
\includegraphics{rectangle}
\caption{A Rectangle}
\label{fig:rectangle}
\end{figure}

Figure 7.2 A Circle

Figure 7.3 A Rectangle

7.2 Tables

Tables are produced in much the same way as figures, except that the table environment is used instead.
\begin{table}[htbp]
\caption{A Sample Table}
\label{tab:sample}
\centering
\begin{tabular}{lr}
Item & Cost \\
Video & 8.99 \\
CD & 9.99 \\
DVD & 15.00 \\
\end{tabular}
\end{table}

This produces Table 7.1.

Table 7.1 A Sample Table

<table>
<thead>
<tr>
<th>Item</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video</td>
<td>8.99</td>
</tr>
<tr>
<td>CD</td>
<td>9.99</td>
</tr>
<tr>
<td>DVD</td>
<td>15.00</td>
</tr>
</tbody>
</table>

Again, the \texttt{\textbackslash centering} declaration is used to centre the \texttt{tabular} environment. As with figures, you can create a list of tables using the command

\listoftables

This creates a file with the extension .lot (see Section 2.4). As with the table of contents and list of figures, you will need to \LaTeX your document twice to get the list of tables up-to-date, unless you're using \texttt{latexmk} (as described in Section 5.5) in which case it will be done automatically.
Exercise 17 (Creating Tables)

If you did Exercise 7, you should have a tabular environment in your document. Try turning this into a table, and add Table 7.1. You could also try adding a list of tables. As before, you can download or view the solution.

7.2.1 Side-by-Side Tables

You can create side-by-side tables using an analogous method to the side-by-side figures approach described above.

Example:
This example is similar to the one in Section 7.1.1. Again, take care to ensure that there is no paragraph break between the two \minipage environments.

\begin{table}
\begin{minipage}{0.5\linewidth}
\caption{Prices for 2011}
\label{tab:prices2011}
\centering
\begin{tabular}{lr}
\hline
Item & Price (£) \\
\hline
Widgets & 10.99 \\
Whatsits & 5.99 \\
\hline
\end{tabular}
\end{minipage}%
\begin{minipage}{0.5\linewidth}
\caption{Prices for 2012}
\label{tab:prices2012}
\centering
\begin{tabular}{lr}
\hline
Item & Price (£) \\
\hline
Widgets & 11.99 \\
Whatsits & 6.99 \\
\hline
\end{tabular}
\end{minipage}
\end{table}

This produces Tables 7.2 and 7.3.

<table>
<thead>
<tr>
<th>Table 7.2 Prices for 2011</th>
<th>Table 7.3 Prices for 2012</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item</td>
<td>Price (£)</td>
</tr>
<tr>
<td>Widgets</td>
<td>10.99</td>
</tr>
<tr>
<td>Whatsits</td>
<td>5.99</td>
</tr>
</tbody>
</table>
7.3 Sideways Floats

The rotating package provides the `sidewaysfigure` environment:

\begin{sidewaysfigure}
\centering
\includegraphics[width=0.75\textwidth]{shapes}
\caption{A Sideways Figure}
\label{fig:sideways}
\end{sidewaysfigure}

and the `sidewaystable` environment:

\begin{sidewaystable}
\centering
\begin{tabular}{...}
\caption{A Sideways Table}
\label{tab:sideways}
\end{tabular}
\end{sidewaystable}

which are like `figure` and `table`, respectively, but rotate the entire float (including caption) sideways. This sideways float is always placed on a page of its own.

If you have used the `twoside` class option (or you are using a class like `scrbook`, which defaults to that option) then the sideways floats will be rotated clockwise or anti-clockwise, depending on whether they fall on an even (verso) or odd (recto) numbered page. (Requires a second \LaTeXX run to get it correct.)

**EXAMPLE:**

\begin{sidewaysfigure}
\centering
\includegraphics[width=0.75\textwidth]{shapes}
\caption{A Sideways Figure}
\label{fig:sideways}
\end{sidewaysfigure}

The above code produces Figure 7.4.

7.4 Sub-Floats

Some floats have sub-floats within them. For example, a figure may contain several sub-figures, each of which requires a caption. The simplest way to do this is to use the `subcaption` package that provides the `subfigure` and `subtable` environments:

\begin{subfigure}[⟨pos⟩]{⟨width⟩}
\caption{A Sub-Figure}
\end{subfigure}

\begin{subtable}[⟨pos⟩]{⟨width⟩}
\caption{A Sub-Table}
\end{subtable}

Within these environments, you can use \caption to create a sub-caption. (In addition to the main \caption for the containing figure or table environment.)

**NOTE:**
The subcaption package requires the caption package, but doesn’t automatically load it, so you’ll need to load both:
\usepackage{caption,subcaption}

\textbf{Example:}
This is very similar to the side-by-side figures example from \textit{Section 7.1.1}.

\begin{figure}[htbp]
\begin{subfigure}[b]{0.5\linewidth}
\centering
\includegraphics{rectangle}
\caption{Rectangle}\label{fig:rectangle}
\end{subfigure}\
\begin{subfigure}[b]{0.5\linewidth}
\centering
\includegraphics{circle}
\caption{Circle}\label{fig:circle}
\end{subfigure}
\caption{Two Shapes}\label{fig:shape}
\end{figure}

This produces Figure 7.5. Elsewhere in the document, the figure and its components can be referenced:

Figure\textsuperscript{\textit{\ref{fig:shapes2}}} shows some shapes. Figure\textsuperscript{\textit{\ref{fig:rectangle}}} shows a rectangle and Figure\textsuperscript{\textit{\ref{fig:circle}}} shows a circle.

which produces the following text:

Figure 7.5 shows some shapes. Figure 7.5a shows a rectangle and Figure 7.5b shows a circle.

You can also reference just the sub-float using

\texttt{\subref{⟨label⟩}}

which is analogous to \texttt{\ref}, but only displays the sub-float number without the number associated with its containing float.

\textbf{Example:}

Figure\textsuperscript{\textit{\ref{fig:shapes2}}} shows: (\texttt{\subref{fig:rectangle}}) a rectangle and (\texttt{\subref{fig:circle}}) a circle.

produces

Figure 7.5 shows: (a) a rectangle and (b) a circle.
Figure 7.5 Two Shapes

**Note:**
The subfigure labels (a, b, etc) should typically be in italic [17]. This can be achieved with the caption package using:

\DeclareCaptionLabelFormat{(format-name)}{(code)}

where (format-name) is the name for this new format and (code) is the code used to format the label where #2 gets replaced by the reference number.

Once you have defined a new format, you can then use

\captionsetup[(type)]{(options)}

to switch to that new format. For subfloats, (type) needs to be set to sub. The second argument (options) is a (key)=⟨value⟩ comma-separated list. The key that sets the format is labelformat. (For further details about both \DeclareCaptionLabelFormat and \captionsetup, see the caption package documentation.)

For example, to create a format called em-noparens that displays the number in an emphasized font without parentheses:

\DeclareCaptionLabelFormat{em-noparens}{\emph{#2}}

Now switch to that new format:

\captionsetup[sub]{labelformat=em-noparens}

Note that this only changes the caption label format. It doesn't affect the font used by \ref or \subref. For \ref, you can use the fncylab package, which provides the command:

\labelformat{(ctr)}{(defn)}

Within ⟨defn⟩, use #1 to represent the subfigure value and use \thefigure for the encapsulating figure number. For example:

\labelformat{subfigure}{\thefigure\emph{#1}}

Now

\ref{fig:circle}

will produce

7.5a

Unfortunately, this doesn't work for \subref. Instead you will have to do, for example, the following in the text:
\emph{\subref{fig:circle}}

If you want to add parentheses, the above can be modified to:

\begin{verbatim}
\DeclareCaptionLabelFormat{em-parens}{{\emph{#2}}}
\captionsetup[sub]{labelformat=em-parens}
\labelformat{subfigure}{\thefigure{\emph{#1}}}
\end{verbatim}

For \texttt{\subref}, you will have to do, for example, the following in the text:

(\emph{\subref{fig:circle}})

**Exercise 18 (Creating Sub-Figures)**

Download the image files \texttt{rectangle.pdf} and \texttt{circle.pdf} from http://www.dickimaw-books.com/latex/novices/html/exercises/ (or create your own images) and add Figure 7.5 to your document. You can download or view the solution.
It's possible to define your own commands or redefine existing ones. Be very careful about redefining existing commands; don't redefine a command simply because you want to use the name, only redefine it if you are making a modification. For example, if you want to change the format of the current date, you would redefine \today, but if you want to define a command to display a specific date, you should define a new command with a different name.

There are several reasons why you might want to define a new command:

1. Reduce typing:
   Suppose you have a series of commands or text that you find yourself frequently using, then you could define a command to do all these other commands for you.

   **Example:**
   Suppose you want a lot of large bold slanted sans-serif portions of text within your document. Every time you type those portions of text, you will have to do something like:

   \textsf{\large\bfseries\slshape Some text}  

   It would be much easier if you could use just one command to do all that, called, say, \largeboldslshape:

   \largeboldslshape{Some text}  

   or you could call it, say, \lbsl which is shorter, but slightly less memorable:

   \lbsl{Some text}  

2. Ensure consistency:
   You may find that you want to format an object a certain way.

   **Example:**
   Recall near the end of Section 7.4, I suggested the following to reference a subfigure (when using \subref instead of \ref):

   (\textbf{\subref{fig:circle}})

   For consistency, you might want to define a command, say,
that was the same as ⟨\emph{\subref{(label)}}⟩.

**Another Example**

Suppose your document has a lot of keywords in it, and you want to format these keywords in a different font, say sans-serif, so that they stand out. You could just do:

A \textsf{command} usually begins with a backslash.

however, it is better to define a new command called, say, \keyword that will typeset its argument in a sans-serif font. That way it becomes a lot easier to change the format at some later date. For example, you may decide to splash out and have your keywords typed in a particular colour. In which case, all you need to do is simply change the definition of the command \keyword, otherwise you’ll have to go through your entire document looking for keywords and changing each one which could be very time consuming if you have a large document. You might also decide at some later date to make an index for your document. Indexing all the keywords then becomes much simpler, as again all you’ll need to do is modify the \keyword command.

New commands are defined using the command:

\newcommand{⟨cmd⟩}[⟨n-args⟩][⟨default⟩]{⟨text⟩}

The first mandatory argument ⟨cmd⟩ is the name of your new command, which must start with a backslash. The optional argument ⟨n-args⟩ specifies how many arguments your new command must take. The next optional argument ⟨default⟩ will be discussed later. The final mandatory argument ⟨text⟩ specifies what \LaTeX should do every time it encounters this command.

**Example (No Parameters):**

Let's begin with a trivial example. Suppose I wanted to write a document about a particular course, say "Programming — Languages and Software Construction", and I had to keep writing the course title, then I might decide to define a command that prints the course title rather than having to laboriously type it out every time. Let's call our new command \coursetitle. We want the following code:

The course \emph{\coursetitle} is an undergraduate course.

to produce the following output:

\begin{verbatim}
The course Programming — Languages and Software Construction is an undergraduate course.
\end{verbatim}
Programming --- Languages and Software Construction
so we would define our new command as follows:

\newcommand{\coursetitle}{Programming --- Languages and Software Construction}

Commands must always be defined before they are used. The best place to define commands is in the preamble:

\documentclass{scrartcl}
\newcommand{\coursetitle}{Programming --- Languages and Software Construction}
\begin{document}
\section{\coursetitle}
The course \textbf{\coursetitle} is an undergraduate course.
\end{document}

\textbf{Example (One Mandatory Argument):}
Now let’s try defining a command that takes an argument (or parameter). Let’s go back to our \texttt{example} on the previous page. This command needs to take one argument that is the keyword. Let’s suppose we want keywords to come out in \texttt{sans-serif}, then we could do:

\newcommand{\keyword}[1]{\textsf{#1}}

In this case we have used the optional argument \langle n-args \rangle to \texttt{newcommand}. We want our command \texttt{\keyword} to have one argument, so we have \[1\]. In \texttt{\textsf{#1}} the \#1 represents the first argument. (If we had more than one argument, \#2 would represent the second argument, \#3 would represent the third argument etc. up to a maximum of 9.) So

\texttt{\keyword{commands}}

will be equivalent to

\texttt{\textsf{commands}}

and

\texttt{\keyword{environment}}

will be equivalent to

\texttt{\textsf{environment}}

and so on. Again, it’s best to put the command definition in the preamble to ensure the command won’t be used before it’s defined.
A \texttt{command} usually begins with a backslash.

Now if we want to change the way the keywords are formatted, we can simply change the definition of \texttt{keyword}. Let's modify our code so that the keyword is now in a slanted sans-serif font:

\begin{verbatim}
\documentclass{scrartcl}
\newcommand{\keyword}[1]{\textsf{\slshape #1}}
\begin{document}
A \keyword{command} usually begins with a backslash.
\end{document}
\end{verbatim}

Let's go one stage further. The \texttt{color} package provides the \texttt{declaration}:

\begin{verbatim}
\color{⟨col-name⟩}
\end{verbatim}

which switches the foreground colour to \texttt{⟨col-name⟩}. It also provides the text-block command:

\begin{verbatim}
\textcolor{⟨col-name⟩}{⟨text⟩}
\end{verbatim}

which sets \texttt{⟨text⟩} in the colour given by \texttt{⟨col-name⟩}.

So let's use the \texttt{color} package to make our keywords blue:

\begin{verbatim}
\documentclass{scrartcl}
\usepackage{color}
\newcommand{\keyword}[1]{\textsf{\slshape\color{blue}#1}}
\begin{document}
A \keyword{command} usually begins with a backslash.
\end{document}
\end{verbatim}
Or we could index the keywords. To do this we need the makeidx package and the commands `\makeindex, \index{⟨text⟩}` and `\printindex`:

```latex
\documentclass{scrartcl}
\usepackage{makeidx}
\makeindex
\newcommand{\keyword}[1]{\textsf{\slshape #1}\index{#1}}
\begin{document}
A \keyword{command} usually begins with a backslash.
\printindex
\end{document}
```

For further information about how to create an index, see *A Guide to \LaTeX* [7] or *The \LaTeX Companion* [3]. Alternatively, if you want a brief overview, try *Using \LaTeX to Write a PhD Thesis* [13].

Since it is unlikely that the keyword will contain a paragraph break, we should indicate that this is a short command using the starred form:

```latex
\newcommand*{\keyword}[1]{\textsf{\slshape #1}\index{#1}}
```

Now if you forget to add the closing brace, for example, `\keyword{command`, then \TeX's error checking mechanism will pick up the error sooner. This will give an error message that looks like:

```
! Paragraph ended before \keyword was complete.
<to be read again>
\par
1.604
```

This at least gives you the line number (604 in this example) of the end of the paragraph where the error has occurred.

If you don’t used the starred form of `\newcommand`, then you will get the somewhat less than helpful error:

```
! File ended while scanning use of \keyword.
```

If you have a very large document, it may take a while to track down where exactly you have missed a brace.

**Exercise 19 (Defining a New Command)**

Try typing up the following code:
Then modify your code so that the keywords are in a slanted sans-serif font or modify your code so that the keywords come out in blue (using the color package as in the example earlier). Again you can download or view the result.

**For the more adventurous:**
If you want to create an index as in the previous example, you will need to use the application makeindex. If you used latexmk back in Section 5.5, you can just carry on using that as before. If not you need to do the following in TeXworks:

1. Create the PDF as described in Section 3.1.
2. Select MakelIndex from the drop-down list next to the build (typeset) button (see Figure 8.1).
3. Click on the build button. If all goes well, you won't see anything different. If you see something like the following:

   Couldn’t find input index file exercise19 nor exercise19.idx.

   then you probably forgot to add the command \makeindex to the preamble. Add it in and go back to Step 1.
4. Select pdf\LaTeX from the drop-down list and build the PDF file again. Move to the last page of the PDF, and you should see the index.

---

### 8.1 Defining Commands with an Optional Argument

As mentioned earlier, the \newcommand command has a second optional argument \textit{\texttt{⟨default⟩}}. This allows you to define a command with an optional
\newcommand*{\keyword}[1]{\textsf{\texttt{\textbf{#1}}}\index{#1}}

\begin{document}

A \texttt{keyword} \texttt{command} usually begins with a backslash.

Segments of code may be \texttt{keyword} \texttt{grouped}.

Some \texttt{keyword} \texttt{commands} take one or more \texttt{keyword} \texttt{arguments}.

\texttt{printindex}

\end{document}
argument. For example, suppose we want a command called, say, \price. Suppose we want the following code:
\price{100}
to produce the following output:
£100 excl VAT @ 17.5%
and let's suppose we want an optional argument so that we can change the VAT. That is, we would want the following code:
\price{20}{30}
to produce the following output:
£30 excl VAT @ 20%
Therefore we want to define a command such that if the optional argument is absent we will have 17.5, and if it is present the optional argument will be substituted instead. This command can be defined as follows:
\newcommand{\price}[2][17.5]{\pounds #2 excl VAT @ #1\%}
Here, #1 represents the optional argument (by default 17.5) and #2 represents the mandatory argument (the second argument if the optional argument is present, or the only argument if the optional argument is absent.)
As before, since the argument is unlikely to contain a paragraph break, we should indicate that it is a short command using the starred form:
\newcommand*{\price}[2][17.5]{\pounds #2 excl VAT @ #1\%}

Exercise 20 (Defining Commands with an Optional Argument)

In this exercise, you will need to define a slightly modified version of the above example. Try defining a command called, say, \cost. It should take one optional argument and one mandatory argument. Without the optional argument, it behaves in the same way as the \price example above, so that, say,
\cost{50}
will produce
£50 excl VAT @ 17.5%
but with the optional argument, you can change the excl VAT @ 17.5\% bit. So that, say,
\cost[inc VAT]{50}
will produce
£50 inc VAT
You can download or view the solution.

For the more adventurous:
If you did Exercise 19 and you modified \keyword so that it indexed the keyword, you may have noticed that
\keyword{command}

and

\keyword{commands}

produced separate entries in the index. It would be better to have an optional argument to override the indexing mechanism. For example,

\keyword{command}

should print and index the word “command”, whereas

\keyword[command]{commands}

should print “commands” and index “command”. In other words, we need an optional argument that defaults to the mandatory argument if it is not present. This is how to achieve that type of effect:

\newcommand*{\keyword}[2][\keywordentry]{%
  \def\keywordentry{#2}%
  \textsf{#2}%
  \index{#1}%
}\%

In this example, the default value for the optional argument is set to the command \keywordentry. At the start of \keyword this is defined to be the mandatory argument (as specified by #2) using \TeX's \def command:

\def\keywordentry{#2}

Then typeset the keyword (given in the mandatory argument #2) in a sans-serif font:

\textsf{#2}

Now index the term using the optional argument (#1):

\index{#1}

If an optional argument is specified, #1 will be the given argument, but if the optional argument is missing, #1 will be \keywordentry, which has earlier been set to the mandatory argument #2.

8.2 Redefining Commands

Commands can be redefined using the command:

\renewcommand{⟨cmd⟩}[⟨n-args⟩][⟨default⟩]⟨{text}⟩

8.1 Recall from Chapter 2 (Some Definitions) the percent symbol discards the space resulting from the end of line character.

8.2 \def is too complicated for an introductory \TeX guide but, if you're interested, read \TeXbook [6].
This has exactly the same format as \newcommand but is used for redefining existing commands. Again there is a starred version to indicate that the command is a short command.

**Caveat:**
Never redefine a command whose existing function is unknown to you or just because you want to use a particular command name, regardless of its previous function. By way of illustration: as a production editor, I have to combine articles by different authors into a single book. Each author supplies the \LaTeX code for their own article. Every so often, I get code that redefines a command for the convenience of the author. Later on another author tries to use the same command, on the assumption that the command behaves according to its original definition. This tends to involve the accent commands as they are short and that saves the author typing. It usually goes along these lines: author A redefines \texttt{c} (the cedilla accent command) to display a maths bold ”c” to indicate a vector. Later, author B, uses the cedilla accent, say, in the name François:

Fran\texttt{c}(c)ois

Author A’s hack turns this into Fran\texttt{c}cois.

**Example (Redefining List Labels):**
Recall the \texttt{itemize} environment discussed in Section 4.4.1. You may have up to four nested \texttt{itemize} environments, the labels for the outer environment are specified by the command \texttt{\labelitemi}, the labels for the second level are specified by \texttt{\labelitemii}, the third by \texttt{\labelitemiii} and the fourth by \texttt{\labelitemiv}. By default, \texttt{\labelitemi} is a bullet point (•), \texttt{\labelitemii} is an en dash (–), \texttt{\labelitemiii} is an asterisk (*) and \texttt{\labelitemiv} is a centred dot (.). These can be changed by redefining \texttt{\labelitemi} etc.

Recall from Table 4.2 that the command \texttt{\dag} produces a dagger symbol, we can use this symbol instead of a bullet point:

```
\renewcommand*{\labelitemi}{\dag}
\begin{itemize}
  \item Animal
  \item Mineral
  \item Vegetable
\end{itemize}
```

Input
\begin{itemize}
  \item Animal
  \item Mineral
  \item Vegetable
\end{itemize}

Output:
\begin{itemize}
  \item Animal
  \item Mineral
\end{itemize}
Here’s another example, it uses the PostScript font ZapfDingbats via the `pifont` package:

\begin{itemize}
\item Animal
\item Mineral
\item Vegetable
\end{itemize}

Output:

- Animal
- Mineral
- Vegetable

In the above example, it would actually be easier to use the `dinglist` environment defined in the `pifont` package:

\begin{dinglist}{43}
\item Animal
\item Mineral
\item Vegetable
\end{dinglist}

**Example (Redefining the Default Font):**
Recall from Section 4.5.3 that the default font family is usually the serif (Roman) family. So what happens if you need to write your entire document in, say, Helvetica? The default font family name is stored in:

\familydefault
This command is usually defined to be just \rmdefault, which in turn stores
the name of the default serif font (initially cmr, Computer Modern Roman).
If you want the default font to be sans-serif, all you need do is add the
following line to the preamble:
\renewcommand{\familydefault}{\sfdefault}
\sfdefault stores the name of the default sans-serif font (initially cmss,
Computer Modern Sans-Serif) and the helvet package redefines \sfdefault
to phv, which is the identifier for the Helvetica font. So the following docu-
ment will be in Helvetica:
\documentclass{scrartcl}
\usepackage{helvet}
\renewcommand{\familydefault}{\sfdefault}
\begin{document}
This is a sample document.
\end{document}

Similarly, if you want the default font to be monospaced (typewriter) then
you'd need to do:
\renewcommand{\familydefault}{\ttdefault}
\begin{document}
This is a sample document.
\end{document}

Incidentally, you may have noticed in Section 4.5.3 that although I said
I'd used the an/t/tor and libris packages to set the serif and sans-serif families
for this book, I didn't mention anything about the typewriter (monospaced)
font. I used the TXTT font, but that doesn't have a corresponding package.
You just redefine \ttdefault to txtt:
\renewcommand*{\ttdefault}{txtt}

**EXAMPLE (REDEFINING FIXED NAMES):**
You may have noticed that \LaTeX automatically generates pieces of text such
as “Chapter”, “Figure”, “Bibliography”. These are generated by the com-
mands shown in Table 8.1.

You can change the defaults using \renewcommand. For example, suppose
you want the table of contents to be labelled “Table of Contents”, instead of
the default “Contents”, you would need to do:
\renewcommand*{\contentsname}{Table of Contents}

In fact, the babel package (see Section 5.8) uses this method to redefine the
commands in Table 8.1 whenever you switch language using \selectlanguage
or within the contents of the otherlanguage environment. This unfortunately has
the side-effect that means if you try to redefine these commands, babel will automatically overwrite your definition whenever there's a language change, which includes at the beginning of the
document environment. Instead you need to use babel's \addto mechanism.

\addto{⟨command⟩}{⟨code⟩}
This patches the definition of a command (specified in the first argument) adding \texttt{⟨code⟩} to the end of the command definition. Whenever babel switches the current language, it uses the command \texttt{\captions⟨language⟩}, which performs all the redefinitions of commands like those listed in Table 8.1. For example, if you are using babel with the english option and you want to change \texttt{\contentsname} so that it does “Table of Contents” instead of “Contents”, you need to do:

\begin{verbatim}
\addto{\captionsenglish}{%
   \renewcommand{\contentsname}{Table of Contents}%
}
\end{verbatim}

**Notes:**
Take care if you want to patch an existing command. For example, suppose you want to append something to the action of a command. You might be tempted to do

\begin{verbatim}
\renewcommand*{\foo}{\foo Something else}
\end{verbatim}

This will cause an infinite loop where \texttt{\foo} recursively calls itself. Instead you should use one of the commands provided by the etoolbox package (such as \texttt{\appto}, which has the same syntax as babel's \texttt{\addto} described above). For further details, read the etoolbox documentation.

**Exercise 21 (Renewing Commands)**

If you did Exercises 16 and 17, go back to that document and changed the figures and tables so that they are labelled “Fig” and “Tab” instead of “Figure” and “Table”. Hint: you need to redefine \texttt{\tablename} and \texttt{\figurename}. 

---

**Table 8.1 Predefined Names (†Book and report style classes (such as \texttt{scrreprt} and \texttt{srbook}), ‡article-style classes (such as \texttt{scrartcl}), remainder book, report and article-style classes)**

Chapter 9
Mathematics

As mentioned in the introduction, \LaTeX{} is particularly good at typesetting mathematics. In order to use any of the maths commands we need to be in one of the mathematics environments. There are two basic types of mathematics: in-line maths and displayed maths. In-line maths is mathematics that occurs within a line of text, for example:

The variable $x$ is transformed by the function $f(x)$.

Displayed maths is mathematics that occurs on a line of its own. For example:

A polynomial is a function of the form

$$f(x) = \sum_{i=0}^{n} a_i x^i$$

The maths environments switch to \LaTeX{}'s "math mode", which uses specialist maths fonts and spacing rather than just using an italic font.

If you want to typeset any mathematics, I strongly advise using the amsmath package:

\texttt{\usepackage{amsmath}}

This patches some existing \LaTeX{} commands and environments and also provides many useful additions.

This chapter is just an introduction to typesetting mathematics in \LaTeX{}. If you want a comprehensive guide, I recommend you read Math Mode by Herbert Voß [20], which can be access via texdoc (see Section 1.1):

\texttt{texdoc mathmode}

9.1 In-Line Mathematics

In-line mathematics is created using the math environment. (Note U.S. spelling — "math" not "maths").
Example:

The variable $x$ is transformed by the function $f(x)$.

It’s somewhat cumbersome having to type \begin{math} and \end{math} and it also makes the source code a little difficult to read so there are shorthand notations that can be used instead: \( is equivalent to \begin{math} and \) is equivalent to \end{math}. So the example above can be rewritten:

The variable $(x)$ is transformed by the function $(f(x))$.

There is an even shorter notation: The special character $ is equivalent to both \begin{math} and \end{math}:

The variable $x$ is transformed by the function $f(x)$.

This is considerably easier to type and to read, but you need to make sure that all your $ symbols have matching pairs. The above code will look like:

The variable $x$ is transformed by the function $f(x)$.

The other advantage in using $ over \( and \) is that $ is a robust command, whereas \( and \) are fragile commands and will need to be protected if they occur in a moving argument.

Note: you should always make sure you are in maths mode to typeset any variables (such as $x, y, z$), as this will ensure that the correct maths fonts are used, as well as the appropriate spacing. Similarly, don’t use $ as a short cut for an italic font.

Notice the difference between $(x', y', z')$ and \textit{(x', y', z')}.

Notice the difference between $(x', y', z')$ and $(x', y', z')$.

9.2 Displayed Mathematics

One-line unnumbered displayed mathematics can be created using:

\[ ⟨maths⟩ \]  
Definition

where ⟨maths⟩ is the mathematics to be displayed.

Example:

A linear function is a function of the form
\[ y = mx + c \]  
Output:
A linear function is a function of the form

\[ y = mx + c \]  

Don’t use the displaymath environment or $$...$$ [15]. Use \[ and \] with the amsmath package.

The \texttt{equation} environment provides something similar to \[ \], except that the equation is numbered. Modifying the above example:

\begin{equation}
    y = mx + c
\end{equation}

results in the following output:

\[ y = mx + c \] (9.1)

Normal text can be inserted into the equation using \text{⟨⟨text⟩⟩} which is provided by the amsmath package.

\textbf{Example:}

\[ x = 2 \text{ and } y = -1 \]

results in the following output:

\[ x = 2 \text{ and } y = -1 \]

Recall from \texttt{Section 5.5} that we can \texttt{cross-reference} most things that \LaTeX\ automatically numbers using \texttt{ref} and \texttt{label}. Equations can be cross-referenced in the same way:
Equation \ref{eqn:linear} is a linear function.
\begin{equation}
\label{eqn:linear}
f(x) = mx + c
\end{equation}
\hspace{1cm}
Equation 9.2 is a linear function.
\[f(x) = mx + c\]
\hspace{1cm}
Equation numbers are usually given in parentheses, which can be done using:
Equation~\eqref{eqn:linear}
The amsmath package provides a convenient short cut:
\eqref{⟨label⟩}
So the above can be written as:
Equation~\eqref{eqn:linear}

\textbf{Note:}
Both the \texttt{equation} environment and \texttt{\[...\]} are only designed for one line of maths. Therefore you must not have any line breaks or paragraph breaks within them. The following will cause an error:
\begin{equation}
f(x) = mx + c
\end{equation}

Either remove the blank lines or comment them out:
\begin{equation}
% 
f(x) = mx + c
%
\end{equation}
9.3 Multiple Lines of Displayed Maths

The amsmath package provides the `align` and `align*` environments for aligned equations. The starred version doesn’t number the equations. These environments provide pairs of left- and right-aligned columns. As with the `tabular` environment, use `&` to separate columns and `\` to separate rows. Unlike the `tabular` environment, there is no argument as the column specifiers are predefined. Another difference is that no page breaks can occur in the `tabular` environment, but it’s possible to allow a page break in `align` or `align*` using

\[\text{\texttt{\textbackslash displaybreak}}[\langle n \rangle]\]

immediately before the `\` where it is to take effect. The optional argument is a number from 0 to 4 indicating the desirability to break the page (from 0 the least to 4 the most).

If you want to mix numbered and unnumbered rows, you can use

\texttt{\textbackslash notag}

to suppress the numbering for a particular row in the `align` environment. This command must go before `\` at the end of the row. The default equation numbering can be overridden for a particular row using:

\texttt{\textbackslash tag}\{\langle tag \rangle\}

where \langle tag \rangle is the replacement for the equation number.

Don’t use the `eqnarray` or `eqnarray*` environments. They’re obsolete [15].

**EXAMPLE (UNNUMBERED):**

\begin{align*}
  y &\;=\; 2x + 2 \\
  &=\; 2(x+1)
\end{align*}

\begin{align*}
  y &\;=\; 2x + 2 \\
  &=\; 2(x + 1)
\end{align*}

Note that the equals sign is placed at the start of the second column, after the ampersand `&`. This ensures the correct amount of spacing on either side. If the first line of the above equation was changed to:

\begin{align*}
  y \;&=\; 2x + 2
\end{align*}

...
there wouldn’t be enough space on the right of the equal sign:

\[ y = 2x + 2 \]

**Example (One Row Numbered):**

\[
\begin{align}
y &\notag = 2x + 2 \\
&= 2(x+1)
\end{align}
\]

\[ y = 2x + 2 \\
= 2(x + 1) \quad (9.3) \]

**Example (Four Columns):**

\[
\begin{align*}
y &\notag = 2x + 2 & z &= 6x + 3 \\
&= 2(x+1) & &= 3(2x+1)
\end{align*}
\]

\[ y = 2x + 2 \\
= 2(x + 1) \quad z = 6x + 3 \\
= 3(2x + 1) \]

As with `equation`, you can cross-reference individual rows of an `align` environment, but you must remember to put `\label` before the end of row `\` separator. You can reference a row in the `align*` environment if you have assigned it a tag with `\tag`, but don’t try labelling a row in the `align` environment where the numbering has been suppressed with `\notag`.

**Example (Cross-Referenced):**

This example has two numbered equations in an `align` environment, both of which are labelled and referenced:
The function $f(x)$ is given in Equation~\eqref{eq:fx}, and its derivative $f'(x)$ is given in Equation~\eqref{eq:dfx}.

\begin{align}
  f(x) &= 2x + 1 \label{eq:fx} \\
  f'(x) &= 2 \label{eq:dfx}
\end{align}

The function $f(x)$ is given in Equation (9.4), and its derivative $f'(x)$ is given in Equation (9.5).

\begin{align*}
  f(x) &= 2x + 1 \quad (9.4) \\
  f'(x) &= 2 \quad (9.5)
\end{align*}

Recall the command \text{⟨text⟩} from the previous section. This can be used within cells of the \texttt{align} and \texttt{align*} environments, but the \texttt{amsmath} package also provides

\texttt{\intertext{⟨text⟩}}

which can be used for a line of interjection between the rows. This command may only go right after \texttt{\\\}.  

\textbf{Example}

\begin{align*}
  y &= 2x + 2 \\
  \text{Using the distributive law:} & \quad 2(x+1) \\
\end{align*}

\begin{align*}
  y &= 2x + 2 \\
  \text{Using the distributive law:} & \quad 2(x + 1)
\end{align*}

There are other environments for multiple-line displayed maths, but they are beyond the scope of this book. See the \texttt{amsmath} documentation for further details.
9.4 Mathematical Commands

Most of the commands described in this section may only be used in one of the mathematics environments. If you try to use a mathematics command outside a maths environment you will get a “Missing $ inserted” error message.

9.4.1 Maths Fonts

Just as we are able to change text fonts using the commands \textit, \textbf etc, we can also use commands to change the maths font. Basic maths font changing commands are shown in Table 9.1.

<table>
<thead>
<tr>
<th>Command</th>
<th>Example Input</th>
<th>Corresponding Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{⟨maths⟩}</td>
<td>$\textit{xyz}$</td>
<td>xyz</td>
</tr>
<tr>
<td>\textbf{⟨maths⟩}</td>
<td>$\textbf{xyz}$</td>
<td>xyz</td>
</tr>
<tr>
<td>\textsf{⟨maths⟩}</td>
<td>$\textsf{xyz}$</td>
<td>xyz</td>
</tr>
<tr>
<td>\mathtt{⟨maths⟩}</td>
<td>$\mathtt{xyz}$</td>
<td>xyz</td>
</tr>
<tr>
<td>\mathit{⟨maths⟩}</td>
<td>$\mathit{xyz}$</td>
<td>xyz</td>
</tr>
<tr>
<td>\mathbf{⟨maths⟩}</td>
<td>$\mathbf{xyz}$</td>
<td>xyz</td>
</tr>
<tr>
<td>\mathcal{⟨maths⟩}</td>
<td>$\mathcal{XYZ}$</td>
<td>𝒳𝒴𝒵</td>
</tr>
</tbody>
</table>

The calligraphic fonts via \mathcal are only available for upper-case characters. Table 9.2 lists additional font commands supplied with the amsmath and amsfonts packages.

<table>
<thead>
<tr>
<th>Command</th>
<th>Example Input</th>
<th>Example Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>\mathbb{⟨maths⟩}</td>
<td>$\mathbb{A+B=C}$</td>
<td>A + B = C</td>
</tr>
<tr>
<td>\mathfrak{⟨maths⟩}</td>
<td>$\mathfrak{A+B=C}$</td>
<td>𝜋 + 2 = C</td>
</tr>
<tr>
<td>\textbf{⟨maths⟩}</td>
<td>$\textbf{A+B=C}$</td>
<td>\textbf{A + B = C}</td>
</tr>
<tr>
<td>\pmb{⟨symbol⟩}</td>
<td>$\pmb{+-=}$</td>
<td>+- =</td>
</tr>
</tbody>
</table>

9.4.2 Greek Letters

Greek letters that differ from the corresponding Roman letters are obtained by placing a backslash in front of the name.\footnote{So, for example, there is no omicron since it looks the same as a Roman o.} Lower case and upper case Greek letters are shown in Table 9.3 and Table 9.4, respectively. There are also some variants of certain symbols, such as \vartheta as opposed to \theta.
Table 9.3 Lower Case Greek Letters

\(\alpha \ \gamma \ \delta \ \epsilon \ \zeta \ \eta \ \theta \ \iota \ \kappa \ \lambda \ \mu \ \nu \ \xi \ \pi \ \varpi \ \rho \ \varsigma \ \tau \ \upsilon \ \phi \ \psi \ \omega \)

Table 9.4 Upper Case Greek Letters

\(\Gamma \ \Delta \ \Theta \ \Lambda \ \Xi \ \Pi \ \Sigma \ \Upsilon \ \Phi \ \Psi \ \Omega \)

**Example:**
The following code
\[
\[ x' = x + \Delta x \]
\]
produces:
\[
x' = x + \Delta x
\]

9.4.3 Subscripts and Superscripts

Subscripts are obtained either by the command
\(\sb\{\text{maths}\}\)

or by the special character:
\(\_\{\text{maths}\}\)

Superscripts are obtained either by the command
\(\sp\{\text{maths}\}\)

or by the special character:
\(^\{\text{maths}\}\)

**Examples:**
1. This example uses \(\sb\) and \(\sp\):
\[
\[ y = x\sb{1}\sp{2} + x\sb{2}\sp{2} \]
\]
2. This example uses _ and ^

\[ y = x_{1}^{2} + x_{2}^{2} \]

3. Recall from page 16 that mandatory arguments only consisting of one character don’t need to be grouped, so the above code can also be written as:

\[ y = x_{1}\text{^2} + x_{2}\text{^2} \]

This is simpler than the first two examples. However it’s a good idea to be in the habit of always using braces in case you forgot them when they’re needed.

All three of the above examples produce the same output:

\[ y = x_{1}\text{^2} + x_{2}\text{^2} \]

Notice how the subscript gets tucked under the slope of the \( Y \) in:

\[ Y_{1}\text{^2} \]

Compare with

\[ Y_{1}\text{_{1}\text{^2}} \]

**Example (Nested)**

Subscripts and superscripts can also be nested (note that it is now necessary to group the argument to the superscript command):

\[ f(x) = e^{x_{1}} \]

which produces

\[ f(x) = e^{x_{1}} \]

This example isn’t quite right as \( e \) isn’t actually a variable and shouldn’t be typeset in italic. The correct way to do this is:

\[ f(x) = \text{\textbackslash mathrm{e}^{x_{1}}} \]

which results in:

\[ f(x) = \text{\textbackslash mathrm{e}^{x_{1}}} \]

If you are going to use \( e \) a lot, it will be simpler to define a new command to do this. The definition should go in the preamble:

\[ \text{\textbackslash newcommand{\textbackslash e}{\text{\textbackslash mathrm{e}}} \]}

Then in the document:

\[ f(x_{1}, x_{2}) = e^{x_{1}\text{^2}} + e^{x_{2}\text{^2}} \]

\[ f(x_{1}, x_{2}) = e^{x_{1}\text{^2}} + e^{x_{2}\text{^2}} \]

Take care when nesting subscripts or superscripts. The following

\[ x_{1\_2} \]

will give a ! Double subscript error.
9.4.4 Functional Names

Functions such as log and tan can’t simply be typed in as log or tan otherwise they will come out looking like the variables $l$ times $o$ times $g$ (log) or $t$ times $a$ times $n$ (tan). Instead you should use one of the commands listed in Table 9.5. The functions denoted with † can have limits by using the subscript command _ or the superscript command ^. In addition, the modulo commands listed in Table 9.6 are also available.

Table 9.5 Function Names († indicates command may have limits, ‡ defined by amsmath).

Table 9.6 Modulo Commands († defined by amsmath package)

<table>
<thead>
<tr>
<th>Command</th>
<th>Example Input</th>
<th>Example Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>\bmod</td>
<td>\mod n</td>
<td>m mod n</td>
</tr>
<tr>
<td>\pmod</td>
<td>\mod n</td>
<td>m \mod n</td>
</tr>
<tr>
<td>\pod</td>
<td>\pod n</td>
<td>m \mod n</td>
</tr>
</tbody>
</table>

Example (Trigonometric Functions):
This example uses the cos and sin functions and also the Greek letter theta.

\[
\[ z = r(\cos \theta + i \sin \theta) \]
\]

Input

\[
\begin{align*}
\text{\textit{Input}} & \quad z = r(\cos \theta + i \sin \theta) \\
\text{Output} & \\
\end{align*}
\]

Example (Limit):
The command \infty is the infinity symbol $\infty$, and the command \to displays an arrow pointing to the right. Note the use of _ since the limit is a subscript.

\[
\[ \lim_{x \to \infty} f(x) \]
\]

Input

\[
\begin{align*}
\text{\textit{Input}} & \quad \lim_{x \to \infty} f(x) \\
\text{Output} & \\
\end{align*}
\]
The operators with limits behave differently depending on whether they are in displayed or in-line maths. Notice the difference when the same code appears in-line:

In a line of text $\lim_{x \to \infty} f(x)$

which now displays as:

In a line of text $\lim_{x \to \infty} f(x)$

**Example (With Subscript):**
This is another example of a functional name using a subscript:

\[ \min_x f(x) \]

Again, notice the difference when it is used in-line:

In a line of text $\min_x f(x)$

In a line of text $\min_x f(x)$

**Defining New Functional Operators**

It may be that you want a function that isn’t specified in Table 9.5. In this case, the \texttt{amsmath} provides the \texttt{preamble only} command

\texttt{\DeclareMathOperator\{⟨cmd⟩\\}{⟨operator name⟩}}

or its \texttt{starred} variant

\texttt{\DeclareMathOperator*\{⟨cmd⟩\\}{⟨operator name⟩}}

Both versions define a command called \texttt{⟨cmd⟩}, which must start with a backslash, that typesets \texttt{⟨operator name⟩} as a function name. The starred version is for function names that can take limits (like \texttt{\lim} and \texttt{\min} described above).

**Example (Operator Without Limits):**
Suppose I want a function called card, which represents the cardinality of a set $\mathcal{S}$. First I need to define the new operator command (which I’m going to call \texttt{\card}) in the \texttt{preamble}:

\texttt{\DeclareMathOperator\{\card\\} \{card\}}

This operator doesn’t take any limits, so I have used the unstarred version.

Later in the document, I can use this new operator command:

\texttt{\[ n = \card(\mathcal{S}) \]}  

$n = \text{card}(\mathcal{S})$

In this example \texttt{\mathcal} is used as sets are typically represented in a calligraphic font.
Example (Operator With Limits):
Suppose I now want a function called mode, which represents the mode of a set of numbers. First, I define the operator command in the preamble:

\[ \text{\texttt{\textbackslash DeclareMathOperator}\*{\texttt{\textbackslash mode}}{\texttt{mode}}} \]

This operator needs to be able to have a subscript, so I have used the starred version.

Later in the document, I can use this new operator command:

\[ x_m = \text{mode}_{x \in \mathcal{S}}(x) \]

9.4.5 Fractions

Fractions are created using the command

\[ \text{\texttt{\textbackslash frac}\{\langle\text{numerator}\rangle\}\{\langle\text{denominator}\rangle\}} \]

The amsmath package also provides the command

\[ \text{\texttt{\textbackslash cfrac}\{\langle\text{pos}\rangle\}\{\langle\text{numerator}\rangle\}\{\langle\text{denominator}\rangle\}} \]

which is designed for continued fractions. The optional argument pos can be used for left (l) or right (r) placement of any of the numerators. (The default is centred.)

Example:
A simple fraction:

\[ \text{\texttt{\textbackslash frac}\{1\}\{1+x\}} \]

Produces:

\[ \frac{1}{1+x} \]

Compare with:

In-line: $ \frac{1}{1+x} $ which produces:

In-line: $ \frac{1}{1+x} $ Output

Example (Nested):

\[ \text{\texttt{\textbackslash frac}\{1+\text{\textbackslash frac}\{1\}\{x\}\}\{1+x+x^2\}} \]

Example (Continued Fraction):
A continued fraction (example taken from amsmath documentation and uses \texttt{\textbackslash sqrt}, described in Section 9.4.6, and \texttt{\textbackslash dotsb}, described in Section 9.4.7):
\[ \cfrac{1}{\sqrt{2} + \cfrac{1}{\sqrt{2} + \cfrac{1}{\sqrt{2} + \ldots \cfrac{1}{\sqrt{2} + \ldots} \ldots} \ldots} } \]

\[ \cfrac{1}{\sqrt{2} + \cfrac{1}{\sqrt{2} + \cfrac{1}{\sqrt{2} + \ldots \cfrac{1}{\sqrt{2} + \ldots} \ldots} \ldots} } \]

**Example (A Derivative):**
\[
\frac{df}{dx}
\]
\[ f'(x) = \frac{df}{dx} \]

As with “e”, the differential operator “d” should be in an upright font as it is not a variable:
\[
\frac{\mathrm{d}f}{\mathrm{d}x}
\]
\[ f'(x) = \frac{\mathrm{d}f}{\mathrm{d}x} \]

The above example is rather cumbersome, particularly if you have a lot of derivatives, so it might be easier to define a new command (see Chapter 8 (Defining Commands)). In the preamble define:
\[ \newcommand{\deriv}{[2]{\frac{\mathrm{d}f}{\mathrm{d}x}}} \]
Then in the document:
\[ f'(x) = \deriv{f}{x} \]
\[ f'(x) = \frac{df}{dx} \]

**Example (Partial Derivative):**
Partial derivatives can be obtained similarly using the command \texttt{\partial} to display the partial derivative symbol. As in the previous example, first define a new command to format a partial derivative in the \texttt{preamble}:
\newcommand{\pderiv}[2]{\frac{\partial #1}{\partial #2}}

Then in the document:
\[ f_x = \pderiv{f}{x} \]

\[ f_x = \frac{\partial f}{\partial x} \]

**EXAMPLE (DOUBLE PARTIAL DERIVATIVE):**
\[
\begin{align*}
    f_{xy} &= \frac{\partial^2 f}{\partial x \partial y} \\
    f_{xy} &= \frac{\partial^2 f}{\partial x \partial y}
\end{align*}
\]

**EXAMPLE (FIRST PRINCIPLES):**
\[
\begin{align*}
    f'(x) &= \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} \\
    f'(x) &= \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}
\end{align*}
\]

9.4.6 Roots

Roots are obtained using the command
\texttt{\textbackslash sqrt\{\langle order\rangle\}\{\langle maths\rangle\}}

without the optional argument \texttt{\langle order\rangle} it will produce a simple square root.
Cubic roots etc can be obtained using the optional argument.

**EXAMPLES:**

1. A square root:
\[
\begin{align*}
    \sqrt{a + b}
\end{align*}
\]

2. A cubic root:
\[
\begin{align*}
    \sqrt[3]{a + b}
\end{align*}
\]
3. An \( n \)th root:
\[
\sqrt[n]{a+b}
\]

9.4.7 Mathematical Symbols

Relational symbols are shown in Table 9.7. If you want a negation that is not shown, you can obtain it by preceding the symbol with the command \texttt{not}. For example: \texttt{not}{\textbackslash subset} produces the symbol \( \subset \).

</tbody>
</table>
Symbols that can have limits are shown in Table 9.11. The size of these symbols depends on whether they are in displayed maths or in-line maths.

**Example (Displayed Summation and Product):**
The limits of summations and products are placed above and below the symbol in displayed maths:

\[
f(x) = \sum_{i=1}^{n} x_i + \prod_{i=1}^{n} x_i
\]
Table 9.10 Over and Under Arrows (defined by amsmath)

<table>
<thead>
<tr>
<th>Definition</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>\overleftarrow{(maths)}</td>
<td>\overleftarrow{ABC} A\text{BC}</td>
</tr>
<tr>
<td>\overrightarrow{(maths)}</td>
<td>\overrightarrow{ABC} A\text{BC}</td>
</tr>
<tr>
<td>\overleftrightharpoon{(maths)}†</td>
<td>\overleftrightharpoon{ABC} A\text{BC}</td>
</tr>
<tr>
<td>\underleftarrow{(maths)}†</td>
<td>\underleftarrow{ABC} A\text{BC}</td>

<tr>
<td>\underrightarrow{(maths)}†</td>
<td>\underrightarrow{ABC} A\text{BC}</td>
</tr>
<tr>
<td>\underleftrightharpoon{(maths)}†</td>
<td>\underleftrightharpoon{ABC} A\text{BC}</td>
</tr>
</tbody>
</table>

Table 9.11 Symbols with Limits

\begin{align*}
\sum & \quad \prod \\
\int & \quad \coprod \\
\bigcap & \quad \bigcup \\
\bigvee & \quad \bigwedge \\
\bigotimes & \quad \bigoplus
\end{align*}

\[ f(x) = \sum_{i=1}^{n} x_i + \prod_{i=1}^{n} x_i \]

**Example (In-line Summation and Product):**
The limits of summation and products are placed to the right of the symbol in in-line maths:

\begin{align*}
\text{In a line of text:} & \quad f(x) = \sum_{i=1}^{n} x_i + \prod_{i=1}^{n} x_i \\
\text{In a line of text:} & \quad f(x) = \sum_{l=1}^{n} x_l + \prod_{l=1}^{n} x_l
\end{align*}

**Multiline Sub- or Superscripts**
The amsmath package provides the command:

\begin{align*}
\text{\texttt{\substack{(maths)}}} & \quad \text{Definition} \\
\text{which can be used for multiline sub- or superscripts. Within the argument} & \quad (maths) \text{ use } \\text{to separate rows. For example:}
\end{align*}

\begin{align*}
\text{\texttt{\textbackslash [}} & \quad \text{\texttt{\textbackslash sum\_{}}}
\end{align*}
9.4.8 Ellipses

Ellipsis (omission mark) commands are shown in Table 9.12. The amsmath package also provides: $\dotsc$ for dots with commas, $\dotsb$ for dots with binary operators/relations, $\dotsm$ for multiplication dots, $\dotsi$ for dots with integrals and $\dotso$ for other dots, which can be used as replacements for $\ldots$ and $\cdots$.

Table 9.12 Ellipses († provided by amsmath package)

\begin{verbatim}
vdots  \cdots  \dotsc  \dotsb  \dotsi  \dotsm
\end{verbatim}

**Example (Low Ellipsis):**
This example uses the command $\forall$ to produce the “for all” symbol $\forall$, and it also uses $\backslash \omega$ (backslash space) to make a space before the for all symbol. The amsmath “dots with commas” ellipsis $\dotsc$ is used rather than the standard $\ldots$:

\begin{verbatim}
a_i x_i = b_i \forall i = 1, \dotsc, n
\end{verbatim}

**Example (Centred Ellipsis):**
This example uses the amsmath “dots with binary operators/relations” $\dotsb$ instead of the standard $\cdots$:
Exercise 22 (Maths: Fractions and Symbols)

This exercise uses a fraction, a square root, subscripts, superscripts and symbols. Try to reproduce the following output:

The quadratic equation

\[ \sum_{i=0}^{2} a_{i} x^{i} = 0 \]

has solutions given by

\[ x = \frac{-a_{1} \pm \sqrt{a_{1}^{2} - 4a_{2}a_{0}}}{2a_{2}} \]

Again you can download or view the solution.

9.4.9 Delimiters

Placing brackets around a tall object in maths mode, such as fractions, does not look right if you use normal sized brackets. For example:

\[ \left( \frac{1}{1+x} \right) \]

results in:

\( \frac{1}{1 + x} \)

Instead, you can automatically resize the delimiters using the commands:

\textbackslash left\langle delimiter \rangle

and

\textbackslash right\rangle\langle delimiter \rangle
Note that you must always have matching \left and \right commands, although the delimiters used may be different. If you want one of the delimiters to be invisible, use a \. (full stop) as the delimiter. Available delimiters are shown in Table 9.13. (Note for a vertical bar delimiter it’s best to use amsmath’s \lvert command instead of | and \lVert instead of \|.) Sometimes using \left and \right doesn’t produce the optimal sized delimiters. In which case you can use additional commands provided by the amsmath package shown in Table 9.14.

Table 9.13 Delimiters (defmed by amsmath)

| ( | ) | [ | ] | \lvert† | \rvert† |
| \{ | \} | \lVert† | \rVert† |
| \lVert† | \lvert† | \rVert† | \rvert† |
| \lfloor | \rfloor | \lceil | \rceil |
| \uparrow | \downarrow | \Uparrow | \Downarrow |
| \updownarrow | \Updownarrow | / | \backslash |

**Example (Vertical Bar Delimiters):**

\[
\left\lvert \frac{1}{1+x} \right\rvert
\]

**Example (Delimiter with Subscript):**
Delimiters can take limits:

\[
\left\lvert \frac{1}{1+x} \right\rvert_{x=0}
\]
Table 9.14 Additional Commands Provided by amsmath for Delimiter Sizing

<table>
<thead>
<tr>
<th>Definitions</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Size</strong></td>
<td></td>
</tr>
<tr>
<td>$( X )$</td>
<td>$( X )$</td>
</tr>
<tr>
<td>\bigl(delim) \bigr(delim)</td>
<td>$\bigl( X \bigr)$</td>
</tr>
<tr>
<td>\Bigl(delim) \Bigr(delim)</td>
<td>$\Bigl( X \Bigr)$</td>
</tr>
<tr>
<td>\biggl(delim) \biggr(delim)</td>
<td>$\biggl( X \biggr)$</td>
</tr>
<tr>
<td>\Biggl(delim) \Biggr(delim)</td>
<td>$\Biggl( X \Biggr)$</td>
</tr>
</tbody>
</table>

\[
\left| \frac{1}{1 + x} \right|_{x=0}
\]

**Example (Mismatch):**
The left and right delimiters don't have to match:

\[
\left[ \frac{1}{1+x} \right.
\]

\[
\left\{ \frac{1}{1+x} \right\}
\]

**Example (An Invisible Delimiter):**
Every \right must have a matching \left (and vice versa), so use a . (full stop) for an invisible delimiter.

\[
\left. \frac{\partial f}{\partial x} \right|_{x=0}
\]

We have now covered enough to reproduce the equation shown in Chapter 1 (Introduction):
\newcommand*{\pderiv}{\frac{\partial #1}{\partial #2}}
\newcommand*{\e}{\mathrm{e}}

\[\pderiv[2]{\mathcal{L}}{z_i^\rho} = -\pderiv{\rho_i}{z_i^\rho} \left( \frac{\e^{v_i}}{1-\e^{v_i}} + v_i \frac{\e^{v_i}\pderiv{v_i}{\rho_i}(1-\e^{v_i})}{(1-\e^{v_i})^2} + \e^{2v_i}\pderiv{v_i}{\rho_i}{(1-\e^{v_i})^2} \right)\]

**Note:**
The above code looks a bit complicated, and there are so many braces that it can be easy to lose track, so here are some ways of making it a little easier to type:

1. Whenever you start a new environment type in the \begin and \end bits first, and then insert whatever goes inside the environment. This ensures that you always have a matching \begin and \end. The same goes for \[ and \].

2. Whenever you type any braces, always type the opening and closing braces first, and then insert whatever goes in between. This will ensure that your braces always match up.

So keeping these notes in mind, let's try typing in the code in a methodical manner:

1. Start and end the displayed maths mode:

\[
\[
\]

2. We now need a partial derivative. (The command \pderiv is defined as described earlier on page 153. Make sure you remember to define it, preferably in the preamble.)
3. Let’s do the first argument. This partial derivative is actually a double derivative, which means we need a squared bit on the top along with a calligraphic L:

\[ \pderiv{}{}^2 \mathcal{L} \]

4. The second argument is the \( z_i^\rho \) squared bit. This is a nested superscript \( \{z_i^\rho\}^2 \):

\[ \pderiv{}{}^2 \{z_i^\rho\}^2 \]

5. We can do the next partial derivative in the same way. This one is slightly easier to do:

\[ \pderiv{}{}^2 \mathcal{L} = -\pderiv{}{}\rho_i {z_i^\rho}^2 \]

6. Delimiters also need to occur in pairs, like curly braces and \begin{align} and \end{align}, so let’s do them next:

\[ \pderiv{}{}^2 \mathcal{L} = -\pderiv{}{}\rho_i \left( {z_i^\rho}^2 \right) \]
7. Now we need to do the bits inside the brackets. First of all we have yet another partial derivative:

\[
\frac{\partial^2 \mathcal{L}}{z_i^\rho^2} = -\frac{\partial \rho_i}{z_i^\rho} \left( \frac{\partial v_i}{\rho_i} \right)
\]

8. Now we have a fraction following the partial derivative from the previous step. (Make sure you use braces for the exponential bit: \(e^{v_i}\) is not the same as \(e^{v_i}\). The command \(\text{e}\) is defined as described earlier in Section 9.4.3. Make sure you define it, preferably in the preamble.)

\[
\frac{\partial^2 \mathcal{L}}{z_i^\rho^2} = -\frac{\partial \rho_i}{z_i^\rho} \left( \frac{e^{v_i}}{1-e^{v_i}} + v_i \frac{e^{v_i}}{1-e^{v_i}} \right)
\]

9. This is followed by \(v_i\) times another fraction:

\[
\frac{\partial^2 \mathcal{L}}{z_i^\rho^2} = -\frac{\partial \rho_i}{z_i^\rho} \left( \frac{e^{v_i}}{1-e^{v_i}} + v_i \frac{e^{v_i}}{1-e^{v_i}} \right)
\]

10. The bottom part of the fraction (the denominator) is easier than the top, so let’s do that first:
11. Now for the top part of the fraction (the numerator). To refresh your memory, it should look like:

\[ e^v_i \frac{\partial v_i}{\partial \rho_i} (1 - e^v_i) + e^{2v_i} \frac{\partial v_i}{\partial \rho_i} \]

That’s a bit complicated, so let’s break it down:

a) The first term is:

\[ e^v_i \]

b) The next term is another partial derivative:

\[ \frac{\partial v_i}{\partial \rho_i} \]

c) Then we have:

\[ (1 - e^v_i) \]

d) Next we have to add on:

\[ + e^{2v_i} \]

e) And finally we have:

\[ \frac{\partial v_i}{\partial \rho_i} \]

So the numerator is:

\[ e^v_i \frac{\partial v_i}{\partial \rho_i} (1 - e^v_i) + e^{2v_i} \frac{\partial v_i}{\partial \rho_i} \]
\[
\frac{\partial^2 \mathcal{L}}{\partial z_i^\rho \partial z_i^\rho} = -\frac{\partial \rho_i}{\partial z_i^\rho} \left( \frac{e^{v_i}}{1-e^{v_i}} + v_i \frac{e^{v_i} \frac{\partial v_i}{\partial \rho_i} (1-e^{v_i}) + e^{2v_i} \frac{\partial v_i}{\partial \rho_i}}{(1-e^{v_i})^2} \right)
\]

9.4.10 Arrays

Mathematical structures such as matrices and vectors require elements to be arranged in rows and columns. Just as we can align material in rows and columns in text mode using the \texttt{tabular} environment (Section 4.6), we can do the same in maths mode using the \texttt{array} environment. The \texttt{array} environment has the same format as the \texttt{tabular} environment, however it must be in maths mode. The column half-gaps are given by the length register \texttt{arraycolsep} (analogous to \texttt{tabcolsep}).

Example:

\[
\begin{array}{rrr}
0 & 1 & 19 \\
-6 & 10 & 200
\end{array}
\]

Example (Adding Delimiters):

\[
\left( \begin{array}{rrr}
0 & 1 & 19 \\
-6 & 10 & 200
\end{array} \right)
\]
\end{array}
\right)
\]

\[
\begin{array}{rr|r}
0 & 1 & 19 \\
-6 & 10 & 200
\end{array}
\]

\textbf{Adding a Vertical Rule:}
A vertical rule can be added using \texttt{|} in the column specifier. For example:

\[
\left(\begin{array}{rr|r}
0 & 1 & 19 \\
-6 & 10 & 200
\end{array}\right)
\]

\textbf{Example (Cases):}
This example uses an invisible delimiter:

\[
f(x) =
\begin{cases}
-1 & x < 0 \\
0 & x = 0 \\
+1 & x > 0
\end{cases}
\]

This can be rewritten more compactly using the \texttt{amsmath cases} environment:

\[
f(x) =
\begin{cases}
-1 & x < 0 \\
0 & x = 0 \\
+1 & x > 0
\end{cases}
\]
\[ \begin{cases} 0 & x = 0 \\ +1 & x > 0 \end{cases} \]

\[ f(x) = \begin{cases} -1 & x < 0 \\ 0 & x = 0 \\ +1 & x > 0 \end{cases} \]

The amsmath package provides some convenient environments to typeset matrices: \texttt{pmatrix}, \texttt{bmatrix}, \texttt{Bmatrix}, \texttt{vmatrix} and \texttt{Vmatrix}. These are similar to the \texttt{array} environment except there is no argument, and they add (respectively) (,)\,[,]\,,\{\} and \|\| delimiters. There is also the \texttt{matrix} environment that doesn’t have any delimiters.

\textbf{EXAMPLE:}

\begin{equation}
\begin{pmatrix}
a & b \\
c & d
\end{pmatrix}
\end{equation}

\begin{equation}
\begin{smallmatrix}
a & b \\
c & d
\end{smallmatrix}
\end{equation}

The amsmath package also provides the environment \texttt{smallmatrix} designed for in-line use. You need to add any delimiters explicitly.

\textbf{EXAMPLE:}

Here is a small matrix
\begin{math}
\left( \begin{smallmatrix}
a & b \\
c & d
\end{smallmatrix} \right)
\end{math}
in a line of text.

Here is a small matrix \((a \ b)\) in a line of text.
9.4.11 Vectors

A variable representing a vector can be typeset using the command:

\[ \vec{\langle \text{variable} \rangle} \]  

**Example:**

\[
\vec{x} \]

\[ x \]

Vectors are often typeset in bold. This can be done by *redefining* the \vec command. You could use \mathbf, for example:

\[
\renewcommand{\vec}[1]{\mathbf{#1}}
\]

\[ \vec{x} \cdot \vec{\xi} = z \]

However, as you may have noticed, the Greek letter \( \xi \) has not come out in bold. Here’s an alternative (using \boldsymbol defined in the amslatex package):

\[
\renewcommand{\vec}[1]{\boldsymbol{#1}}
\]

\[ \vec{x} \cdot \vec{\xi} = z \]

Located (or position) vectors, on the other hand, are usually typeset with a right arrow, but the default definition of \vec produces an arrow that is too small:

\[
\vec{OP} \]

\[ \overrightarrow{OP} \]

Instead, use \overrightarrow (Table 9.10):

\[
\overrightarrow{OP} \]

You might prefer to define separate commands for a located vector and a vector variable.
Example:
In the preamble, define \lvec for a located vector and \bvec for a vector variable:

\newcommand*{\lvec}[1]{\overrightarrow{#1}}
\newcommand*{\bvec}[1]{\boldsymbol{#1}}

Later in the document:

Let $\bvec{u}=(x, y)$ represent $\lvec{OP}$, then
\[
\| \bvec{u} \| = \sqrt{x^2 + y^2}
\]

Exercise 23 (Maths: Vectors and Arrays)

Try to produce the following:

$$Ax = \begin{pmatrix} 0 & 1 \\ 2 & 3 \end{pmatrix} \begin{pmatrix} 1 \\ 2 \end{pmatrix} = \begin{pmatrix} 2 \\ 8 \end{pmatrix} = y$$

As before, you can download or view the solution.

9.4.12 Mathematical Spacing

\LaTeX\ deals with mathematical spacing fairly well, but sometimes you may find you want to adjust the spacing yourself. Available spacing commands are listed in Table 9.15.

Exercise 24 (More Mathematics)

This exercise uses the spacing command \qquad. In addition, it has a function name, diag, and it uses the \forall and \ellipses symbols. It also redefines the \vec command, as was done in the previous section, uses the bmatrix environment (see Section 9.4.10), and has subscripts and superscripts.

Try to reproduce the following output:
Table 9.15 Mathematical Spacing Commands (*provided by amsmath*)

<table>
<thead>
<tr>
<th>Command</th>
<th>Example Input</th>
<th>Example Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>$AB$</td>
<td>$A, B$</td>
<td>$AB$</td>
</tr>
<tr>
<td>$\thinspace$ or $,$</td>
<td>$A , B$</td>
<td>$AB$</td>
</tr>
<tr>
<td>$\thickspace$ or $;$</td>
<td>$A ; B$</td>
<td>$AB$</td>
</tr>
<tr>
<td>$\negthinspace$ or $!$</td>
<td>$A ! B$</td>
<td>$AB$</td>
</tr>
<tr>
<td>diag((a)) (x = b)</td>
<td>diag((a)) (x = b)</td>
<td>(A \quad B)</td>
</tr>
</tbody>
</table>

The set of linear equations:

\[ a_i x_i = b_i \quad \forall i = 1, \ldots, n \]

can be written as a matrix equation:

\[ \text{diag}(\(a\)) x = b \]

where \(x = (x_1, \ldots, x_n)^T\), \(b = (b_1, \ldots, b_n)^T\) and

\[
\text{diag}(\(a\)) = \begin{bmatrix}
    a_1 & 0 & \cdots & 0 \\
    0   & a_2 & \ddots & \vdots \\
    \vdots & \ddots & \ddots & 0 \\
    0 & \cdots & 0 & a_n
\end{bmatrix}
\]

Again, you can download or view the solution.
Just as you can define new commands, you can also define new environments. The command
\newenvironment{⟨env-name⟩}[⟨n-args⟩][⟨default⟩]{⟨begin-code⟩}{⟨end-code⟩}
is used to define a new environment. As with new commands, you can use the optional argument ⟨n-args⟩ to define an environment with arguments, and ⟨default⟩ to define an environment with an optional argument.

The first argument ⟨env-name⟩ is the name of your new environment. Remember that the environment name must not have a backslash. The mandatory arguments ⟨begin-code⟩ and ⟨end-code⟩ indicate what \LaTeX should do at the beginning and end of the environment. Note that although ⟨begin-code⟩ can reference the arguments using #1 etc, the ⟨end-code⟩ part can’t.

**Example (An Exercise Environment):**
Let’s first consider an example of an environment without any arguments. Let’s make an environment called, say, exercise that prints Exercise in bold and typesets the contents of the environment in italic, with a gap between the title and the contents. In other words, we want the following code:

\begin{exercise}
This is a sample.
\end{exercise}

To produce the following output:

Exercise

This is a sample.

(In the next chapter we will add numbering.)

Let’s first consider what we want this environment to do: we can get the word “Exercise” in bold using \textbf, and the italic font can be obtained by using the \textit environment (recall Section 4.5). So, at the start of our new environment we need

\textbf{Exercise}\begin{itshape}
and at the end of our new environment we need to end the \textit{\textshape} environment:
\end{\textit{\textshape}}

Putting the above together into the new environment definition:

\begin{verbatim}
\newenvironment{exercise}% environment name
{\begin{verbatim}
\textbf{Exercise}\begin{\textit{\textshape}}%
\end{\textit{\textshape}}%
\end{verbatim}}% end code
\end{verbatim}
\end{verbatim}
\end{verbatim}

Let's try it out:

\begin{exercise}
This is a sample.
\end{exercise}

\textbf{Exercise} \textit{This is a sample.}

Not quite right. Let's put a paragraph break after \textbf{Exercise}, and put one before it as well. The command \texttt{\textbackslash par} can be used to make a paragraph break and the extra bit of vertical spacing can be produced using \texttt{\textbackslash vspace}. The length \texttt{\textbackslash baselineskip} is the interline spacing. Modifications are shown in bold \textit{like this}.

\begin{verbatim}
\newenvironment{exercise}% environment name
{\begin{verbatim}
\par\vspace{\baselineskip}\%
\textbf{Exercise}\begin{\textit{\textshape}}%
\par\vspace{\baselineskip}\%
\end{\textit{\textshape}}%
\end{verbatim}}% end code
\end{verbatim}
\end{verbatim}

Let's have a look at the output now:

\textbf{Exercise}

\textit{This is a sample.}

The indent at the start of each line is caused by the normal paragraph indentation. This can be suppressed using \texttt{\textbackslash noindent}. It's also a good idea to suppress any spaces immediately following \texttt{\textbackslash begin\{exercise\}} and \texttt{\textbackslash end\{exercise\}}, which can be done using \texttt{\textbackslash ignorespaces} and \texttt{\textbackslash ignorespacesafterend}. Modifications are again shown in bold \textit{like this}. 

[FAQ: There's a space added after my environment]
The exercise environment now appears as:

**Exercise**

*This is a sample.*

Now let’s modify our code so that the environment takes an argument. The argument should indicate the exercise topic. For example, the following code:

\begin{exercise}{An Example}
This is a sample.
\end{exercise}

should produce the following result:

**Exercise (An Example)**

*This is a sample.*

As with \texttt{\newcommand}, \#1 is used to indicate the first argument. We can now modify the code as follows:
10.1 Redefining Environments

It is also possible to redefine an environment using:

\renewenvironment{⟨env-name⟩}[⟨n-args⟩][⟨default⟩]{⟨begin-code⟩}{⟨end-code⟩}

As with \renewcommand, only redefine an existing environment if you want a modified version of that environment rather than because you like the environment name.

Exercise 25 (Defining a New Environment)

If you did any of the exercises from Exercise 10 to Exercise 17, go back to the document you created and define the exercise environment as in the example above. Then try creating some exercises using this environment. You could, maybe, put an exercise in the first chapter, and then another one in the second chapter. Again you can download or view an example.
As we have seen, \LaTeX{} automatically generates numbers for chapters, sections, equations etc. These numbers are stored in counters. The names of these counters are usually the same as the name of the object with which it is associated but without any backslash. For example, the \texttt{\chapter} command has an associated counter called chapter, the \texttt{\footnote} command has an associated counter called footnote, the \texttt{equation} environment has an associated counter called equation, the \texttt{figure} environment has an associated counter called figure and the \texttt{table} environment has an associated counter called table. There is also a counter called page that keeps track of the current page number.

The value of a counter can be displayed using the command

\begin{verbatim}
\the⟨counter⟩
\end{verbatim}

where ⟨counter⟩ is the name of the associated counter. Note that ⟨counter⟩ does not go in curly braces and adjoins \the (for example, \texttt{\thepage}, \texttt{\thesection} or \texttt{\thechapter}). In fact, we have already encountered \texttt{\thefigure} in Section 7.4.

**Example:**

This page is Page~\thepage.  
The current chapter is Chapter~\thechapter.

\begin{verbatim}
\newcounter{(counter-name)}
\end{verbatim}

The mandatory argument ⟨counter-name⟩ is the name of your new counter (no backslash in the name). For example, let’s define a counter called exercise to keep track of each exercise. (Recall the exercise example from Chapter 10 (Defining Environments).)

\begin{verbatim}
\newcounter{exercise}
\end{verbatim}

We can now display the value of the counter using the command \texttt{\theexercise}. At the moment the counter has the value zero, the value can be changed using one of the following commands:
\texttt{\textbackslash stepcounter\{\textlangle\textbackslash counter\}\}} \quad \text{Increments \textlangle\textbackslash counter\rangle by 1}

\texttt{\textbackslash refstepcounter\{\textlangle\textbackslash counter\}\}} \quad \text{As above, but allows you to cross-reference the counter using \textbackslash label and \textbackslash ref}

\texttt{\textbackslash setcounter\{\textlangle\textbackslash counter\}\}\{\textlangle num\}\}} \quad \text{Sets the counter to \textlangle num\rangle}

\texttt{\textbackslash addtocounter\{\textlangle\textbackslash counter\}\}\{\textlangle num\}\}} \quad \text{Adds \textlangle num\rangle to \textlangle\textbackslash counter\rangle}

A couple of the commands above take a number \textlangle num\rangle as one of the arguments. If you want to use another counter for this argument, you need to use

\texttt{\textbackslash value\{\textlangle\textbackslash counter\}\}}

For example, if you want to set our new exercise counter to the same value as the page counter, you would do

\texttt{\textbackslash setcounter\{exercise\}\{\textbackslash value\{page\}\}}

Let's go back to the exercise environment you created in Exercise 25. The exercises really ought to have an associated number, and this number should be incremented each time we use the exercise environment. So let's modify our code to do this. Modifications are illustrated in bold \textbf{like this}:

\begin{verbatim}
\newcounter{exercise}
\newenvironment{exercise}[1]% environment name
{% begin code
\par\vspace{\baselineskip}\noindent
\refstepcounter{exercise}%
\textbf{Exercise \textlangle theexercise\rangle (#1)}%
\begin{itshape}
\par\vspace{\baselineskip}%
\noindent\ignorespaces
%
\end{itshape}
\par\vspace{\baselineskip}\noindent\ignorespacesafterend
%
{% end code
\par\vspace{\baselineskip}\noindent\ignorespacesafterend
\end{verbatim}

Note that the counter needs to be incremented before it is used. I've also added an extra \texttt{\vspace} at the end of the environment and a paragraph break. Since we've used \texttt{\refstepcounter} instead of \texttt{\stepcounter} we can cross-reference our exercise environment:
Exercise \ref{ex:simple} is a simple exercise.

\begin{exercise}{Simple Exercise} %
This is a simple exercise.
\end{exercise}

This produces the following output:

Exercise 1 is a simple exercise.

Exercise 1 (Simple Exercise)

This is a simple exercise.

The counter representation can be changed by redefining \theexercise using the \renewcommand command described in Section 8.2. The following commands can be used to display the counter:

\arabic{(counter)} \hspace{1cm} Arabic numeral \(1, 2, 3, \ldots\)
\Roman{(counter)} \hspace{1cm} Upper case Roman numeral \(I, II, III, \ldots\)
\roman{(counter)} \hspace{1cm} Lower case Roman numeral \(i, ii, iii, \ldots\)
\alph{(counter)} \hspace{1cm} Lower case letter \(a, b, c, \ldots, z\)
\Alph{(counter)} \hspace{1cm} Upper case letter \(A, B, C, \ldots, Z\)
\fnsymbol{(counter)} \hspace{1cm} A footnote symbol \(*, †, ‡, §, ¶, \|, **, ††, ‡‡\)

**Example:**
To make the chapter numbers appear as upper case Roman numerals you would do:

\renewcommand{\thechapter}{\Roman{chapter}}

You may have noticed that \newcounter has an optional argument (outer-counter). This is for use if you require the new counter to be reset every time (outer-counter) is incremented. For example, the section numbers in the \scrbook class are dependent on the chapter numbers. Each time a new chapter is started, the section numbers are reset. Suppose we want our exercise counter to be dependent on the chapter counter, we would do

\newcounter{exercise}[chapter]

Note that if you make a counter dependent on another counter like this, the default action of \the\(\text{counter}\) remains the same, so \theexercise
won’t print the chapter number. To make the chapter number appear as well, we need to redefine \theexercise (recall Section 8.2):
\renewcommand{\theexercise}{\thechapter.\arabic{exercise}}
Input
Notice the use of \thechapter instead of, say, \arabic{chapter}. This way we don’t need to keep track of the chapter counter format.

**Example (Footnote Markers):**
The footnote counter is reset at the start of each chapter but by default the chapter number isn’t displayed in \thefootnote. In this book \thefootnote was redefined so that it displays the chapter number:
\renewcommand{\thefootnote}{\thechapter.\arabic{footnote}}
Input

**Exercise 26 (Using Counters)**
Modify the document from Exercise 25 so that the exercise environment has a counter. Make the counter dependent on the chapter. You can download or view an example.
New \LaTeX{} packages are being created all the time, so you may find that there are some packages that you don't have on your installation. In this case, if you don't have the package you want, you can download it from CTAN [1]. Before discussing installing new packages, it is a good idea for you to understand the \LaTeX{} Directory Structure (TDS).

All the files that make up the \LaTeX{} distribution are stored in a standard hierarchical structure. The root directory of the main distribution is usually called texmf or texmf-dist. Its location depends on your system. For example, if you are using \TeX{} Live 2012 on UNIX/Linux, it will probably be located in /usr/local/texlive/2012/texmf-dist or if you are using MiKTeX it may be located in c:\texmf or c:\Program Files\texmf. Whichever system you are using, I shall refer to this directory as \langle TEXMF \rangle. So, if you are using \TeX{} Live 2012, \langle TEXMF \rangle/doc refers to the directory /usr/local/texlive/2012/texmf-dist/doc, or if you are using MiKTeX, \langle TEXMF \rangle/doc refers to the folder c:\texmf\doc or c:\Program Files\texmf\doc. In general, you should not make any modifications to the \langle TEXMF \rangle directory tree as it will get overridden whenever you update your \LaTeX{} distribution.

You should also have a local texmf tree. Again, the location of the local texmf tree depends on your system. If you are using \TeX{} Live, it may be /usr/local/texlive/texmf-local. If you are using MiKTeX, it may be c:\localtexmf or c:\Program Files\localtexmf. Whichever system you are using, I shall refer to this directory as \langle TEXMF-LOCAL \rangle. There is also the \langle TEXMF-HOME \rangle directory. On UNIX-like systems this is usually ~/texmf. On Windows it's usually in your user folder. This is the one where you typically install any new classes or packages.

These directories must all have the same structure. The principle subdirectories relating to \LaTeX{} are illustrated in Figure A.1. It may be that your \langle TEXMF-HOME \rangle directory doesn't exist or doesn't contain some of these sub-directories, if so, you will need to create them.

You can use the kpsewhich application to find out the locations of \langle TEXMF-LOCAL \rangle and \langle TEXMF-HOME \rangle. Since kpsewhich is a command-line application, you will need a command prompt or terminal open (see Section 2.5). At the command prompt, type

\texttt{kpsewhich -var-value=TEXMFHOME}

to display the location of \langle TEXMF-HOME \rangle or
kpsewhich -var-value=TEXMFLOCAL
to display the location of ⟨TEXMF-LOCAL⟩. (Remember to press the enter key at the end of the line.)

The documentation for \LaTeX\ classes and packages can be found in the doc/latex sub-directories: ⟨TEXMF⟩/doc/latex, ⟨TEXMF-LOCAL⟩/doc/latex and ⟨TEXMF-HOME⟩/doc/latex.

![Figure A.1 The \TeX\ Directory Structure (TDS) Showing the Main \TeX-Related Sub-Directories.](image)

Some packages are supplied in this format\textsuperscript{A.1} For example, the package sample-package may be distributed in a compressed file sample-package.tds.zip, which contains the files

doc/latex/sample-package/sample-package.pdf
tex/latex/sample-package/sample-package.sty
tex/latex/sample-package/sample-bar.sty

tex/latex/sample-package/sample-foo.sty

In this case all you need to do is decompress the contents of the archive into the ⟨TEXMF-LOCAL⟩ or ⟨TEXMF-HOME⟩ directory.

On older \TeX\-distributions, you would then need to refresh the \TeX\ database (described in Section A.2 on page 183). With new distributions, you don't need to do this if you are installing a new package into your ⟨TEXMF-HOME⟩ directory.

**Example (UNIX-LIKE):**
To install sample-package.tds.zip (assuming you're in the same directory as that file):

```
unzip -d ~/texmf sample-package.tds.zip
```

### A.1 DTX and INS Files

Not all packages are provided in the TDS \textsuperscript{[14]} format. Instead (or additionally) many are supplied with the code and documentation all bundled together in one file. This file usually has the extension .dtx, and it usually comes with an installation script that has the extension .ins. Once you have downloaded the .dtx and .ins files, you will then have to extract the code before you can use it. Let's go back to the previous example. The package

\textsuperscript{A.1}Complete list at [http://mirror.ctan.org/install/macros/latex/contrib/](http://mirror.ctan.org/install/macros/latex/contrib/).
sample-package is now distributed in a DTX file, so the sample-package.zip archive contains the files

sample-package.dtx sample-package.ins

(with hopefully a README or INSTALL file). Note that this archive, unlike the TDS one, doesn’t contain any .sty files. The documentation source and the package code (sample-package.sty, sample-foo.sty and sample-bar.sty) are all contained in the file sample-package.dtx. This is how to extract them:

1. Extract the contents of sample-package.zip to a temporary directory.

2. Run \LaTeX{} on the file sample-package.ins. If you are using a terminal, you can type the following at the command prompt:

   \texttt{latex \textasciitilde sample-package.ins}

   If you are using a front-end, such as TeXWorks, open the .ins file (for example sample-package.ins), and click on the build/typeset button.

   This will create the files containing the package code. In this example it will create the main package file sample-package.sty and supplementary packages sample-foo.sty and sample-bar.sty.

3. Make a sub-directory of \texttt{TEXMF-LOCAL/tex/latex} in which to place these files. In this example, the package is called “sample-package”, so make a sub-directory called sample-package.

4. Move the files created in Step 2 into the new sub-directory you created in the previous step.

5. Run \texttt{PDFTeX} on the file sample-package.dtx. (The same as in Step 2, but use the file sample-package.dtx instead of sample-package.ins.) This will create a file called sample-package.pdf. You may need to repeat this step to ensure that the cross references are up-to-date. Check the README file or INSTALL file to see if there is anything else you need to do. (If you have downloaded the package from CTAN, it's possible that the documentation has already been supplied, as package authors are encouraged to supply a PDF version of the documentation for online viewing. If so, you can omit this step.)

6. Make a sub-directory of \texttt{TEXMF-LOCAL/doc/latex} in which to place the documentation. In this example, the package is called “sample-package”, so make a sub-directory called sample-package.

7. Move the files created in Step 5 into the new sub-directory you created in the previous step.

As mentioned above, on older \TeX{}-distributions, you would then need to refresh the \TeX{} database, but this isn’t required for \texttt{TEXMF-HOME} installs on new distributions.

\textsuperscript{A2}or \texttt{TEXMF-LOCAL/tex/latex} on Windows

\textsuperscript{A3}or \texttt{TEXMF-LOCAL/doc/latex} on Windows
A.2 Refreshing the \TeX{} Database

On older \TeX{} distributions you had to refresh the \TeX{} database whenever you installed new classes or packages. With newer installations you don’t need to do this if you install them in your $\langle \text{TEXMF-HOME} \rangle$ directory, except under certain circumstances (for example, you’re using a networked drive). If it turns out that \TeX{} can’t find a new class or package you have installed in $\langle \text{TEXMF-HOME} \rangle$ you will need to update the database using the \texttt{texhash} (or \texttt{mktexlsr}) application. This is a command-line application, so you need a terminal or command prompt (see Section 2.5).

For example, on UNIX/Linux, to update $\langle \text{TEXMF-HOME} \rangle$ (the directory $\sim$/\texttt{texmf}) you need to type the following at the command prompt:

\begin{verbatim}
texhash ~/texmf
\end{verbatim}

If you are using a modern \TeX{} distribution, such as \TeX{}Live, \TeX{} Live or \TeX{} for Mac you should be a package manager that has a package installation and refresh facility. For example, \TeX{} Live comes with the \TeX{} Live Manager (\texttt{tlmgr} or \texttt{mactlmgr}) and recent versions of \TeX{}Live have an application called \TeX{}Live Update Wizard which can automatically download and install known packages.

If you experience any problems, contact your system administrator for help or try one of the resources listed in Appendix C (Need More Help?).

\textbf{Related UK FAQ [18] topics:}

- Installing things on a \TeX{} system
- Installing files “where \TeX{} can find them”
- Installation using MiKTeX package manager
- “Temporary” installation of \TeX{} files
- “Private” installations of files
Appendix B

Common Errors

• If you’re running \LaTeX{} from a terminal and the only message that gets displayed is:

latex: Command not found.

or

Bad command or file name

then you have either mistyped the command name, or you don’t have \LaTeX{} installed on your computer, or your path hasn’t been set up correctly. First check that you have typed the command correctly, then check to see if you have \LaTeX{} installed. Failing that, contact your system administrator for help or try one of the resources listed in Appendix C (Need More Help?).

• If you’re running \LaTeX{} from a terminal and you get the message (or something similar):

This is TeX, Version 3.14159 (Web2C 7.3.1)
! I can’t find file ‘sample’.
<*> sample

Please type another input file name:

then you have either misspelt the filename or you are in the wrong directory. If you have misspelt the filename, simply type in the correct name at the prompt. If you are in the wrong directory or you want to quit, type \texttt{X} followed by the return character \texttt{←}. To check you are in the right directory, on a Unix-like system you can type:

\texttt{ls}

This will list the contents of the directory. If you are certain that you have spelt the filename correctly and that you are in the right directory, there may be something wrong with your path, in which case contact your system administrator.

• Error messages will usually look something like:
! Undefined control sequence.
1.1 \documentclass

  [12pt]{scrartcl}

The first line is the error message. In this example I have misspelt the command \documentclass. The next line begins with l. followed by a number. This is the line number in the source code where the error occurred. In this case the error occurred on line 1. Following the line number is the input line \LaTeX has processed so far, and staggered on the next line is the remainder of the input line.

Here's another example. Suppose line 8 of my source code looks like:

The date today is: \today, which is nice to know.

The error in this case is the misspelling of the command \today. The error message will appear as follows:

! Undefined control sequence.
1.8 The date today is \today, which is nice to know.

At the \LaTeX prompt, you can either type h for a help message, or type x to exit \LaTeX and go back to your source code and fix the problem.

There follows below a list of common error messages. If your problem isn't listed there, try the UK FAQ [18].

B.1 * (No message, just an asterisk prompt!)

You've gone into \TeX! This is probably because you've forgotten the \end{document}. The asterisk is the \TeX prompt. At this point the best thing to do is to abort the \TeX run.

B.2 Argument of \cline has an extra }

If this error occurred on the first line in your tabular environment, you may have forgotten the argument to the tabular environment.

B.3 Argument of \multicolumn has an extra }

If this error occurred on the first line in your tabular environment, you may have forgotten the argument to the tabular environment.
B.4 \begin{...} ended by \end{...}

The beginning of your environment doesn’t have a matching end.

- Check to make sure you have spelt the name of the environment correctly.
  You will get this error message if you do, say,

\end{docment}

instead of

\end{document}

- Check that for every \begin you have a corresponding \end with the same name.

B.5 Bad math environment delimiter

Only a certain type of character may be used as a delimiter (for example, ( ) [ ]), check which one you have specified. This error may also occur if you have forgotten a \right or not used it in the same scope. (Remember to use a . if you want an invisible delimiter) or you may have forgotten to end your array environment with \end{array}.

B.6 Can only be used in preamble.

Some commands, such as \usepackage may only appear in the preamble. Check to see where you have put it. For example, this error will be caused by doing:

\documentclass{scrartcl}
\begin{document}
\usepackage{graphicx}

instead of

\documentclass{scrartcl}
\usepackage{graphicx}
\begin{document}
B.7 Command ... already defined

You have tried to define a command which already exists. Try giving it a different name. Remember never to redefine a command if you don’t know what the command originally does.

Alternatively, you have tried to define an environment which already exists. Give the new environment a different name. Again, never redefine an environment where you don’t know what the original environment does.

B.8 Display math should end with $$

You may have a dollar sign ($$) in a displayed maths environment, such as the equation environment. Remember that $ is shorthand for \begin{math} or \end{math}, so you can’t end one of the other environments with a $. (This error message is in fact a bit confusing, as it seems to be suggesting that you end a displayed maths environment with $$ which you also shouldn’t do.)

B.9 Environment ... undefined

LaTeX doesn’t recognise the environment you have specified.

- Check you have spelt the environment name correctly. You will get this error if you do, say,

\begin{docment}

instead of

\begin{document}

- If it’s your own environment, check you have defined the environment before using it.

- If the environment is defined in a package, check you have included the package using the \usepackage command.

B.10 Extra alignment tab has been changed to \cr

You have too many ampersands (&) in one row. The most probable cause is that you have forgotten the end of row command \\ on the previous row. Remember also that if you have a \multicolumn command to span more than one column, you should have fewer &s in that row. This error can also occur from a confusion over the two meanings of \: a line break within a paragraph cell and a row break. In which case, you need to use \tabularnewline instead of \\.
B.11 Extra \right

There are a number of possible causes. The most probable is that you have a \right that doesn’t have a matching \left. (Remember left comes before right.) Another possible cause is that you have missed out \end{array}. (Remember that environments provide implicit grouping, and \left and its matching \right must appear within the same group level.)

B.12 File ended while scanning use of ...

The most usual cause of this error is a missing closing brace.

You will get this error if you do, say,

\end{document}  

instead of

\end{document}

B.13 File not found

\LaTeX{} can’t find the file you have specified. You will be given the opportunity to type in the correct filename at the prompt. If you want to quit, simply type X followed by the return character ±.

• Make sure that you have spelt the filename correctly.

This error will be caused by, say,

\documentclass{scrarticle}  

instead of

\documentclass{scartcl}

If this is the case, simply type in the correct name at the prompt (followed by the return character ±) then go back and fix the spelling in the source code.

• Make sure that the file is in the same directory as your document or in the \LaTeX{} path. If the file is in another directory (not in the \LaTeX{} path), you will need to specify the pathname, but remember that when using \LaTeX{} under Windows, you need to use a forward slash (/) as the directory divider, as a backslash would be interpreted as a command. For example, if you have a file called shapes.pdf in the subdirectory pictures then you would get a “file not found” error message if you did

\includegraphics{shapes}
instead of
\includegraphics{pictures/shapes}

- If the file is a package or class file, it's possible that you don't have that file installed on your computer. If this is the case you will need to download and install it as described in Appendix A (Downloading and Installing Packages). Remember that you need to refresh the database after installing a new package or class file.

### B.14 Illegal character in array arg

You have used a character in the argument of a tabular or array environment that is not allowed. The standard available characters are: \(r\) (right justified), \(l\) (left justified), \(c\) (centred) and \(p\), as well as \{@\{inter-col text\}\}. Remember that if you want to use the \(>\{\{decl\}\}\) or \(<\{\{decl\}\}\) specifiers, you must include the array package.

This error will also occur if you have forgotten the argument to the tabular or array environment.

### B.15 Illegal parameter number in definition

You have referred to a parameter (argument) number that is greater than the number of parameters you have specified. For example, suppose you defined the command to have only one parameter, then you can't use \#2 which refers to the second, non-existent, parameter. Remember that you need to specify how many parameters you want in the optional argument to \texttt{\newcommand}, otherwise it will be assumed that the command has no arguments.

### B.16 Illegal unit of measure (pt inserted)

You have either not specified a unit when giving a length (even zero lengths must have a unit) or you have specified an invalid unit or you have misspelt the unit. Available units are listed in Table 2.1.

### B.17 Lonely \item

The command \item may only appear in one of the list making environments (such as \itemize). Make sure you haven't forgotten your environment.

### B.18 Misplaced alignment tab character &

You have used the special character & where you shouldn't have. Recall from Section 4.3 that if you want an & sign to appear you need to do \& not just &.
You would have got this error message if you had done, say,

```
\& our equipment
```

instead of

```
\& our equipment
```

B.19 Missing } inserted

You have missed a closing curly brace, or you may have missed out an argument.

**Example:**

If the following line occurs in a tabular environment:

```
& \multicolumn{2}{c}
```

this will produce the error. (The third argument to \multicolumn has been omitted.)

B.20 Missing $ inserted

This message can be caused by a number of errors:

- You might have missed the beginning of one of the mathematics environments (that is, you've used a command that must only appear in maths mode).

- You may have typed \$ instead of $ (you actually want a dollar symbol to appear). Recall from Section 4.3 that if you want a $ sign to appear you need to do $ not just \$.

You would have got this error message if you had done, say,

```
expenditure came to $2000.00
```

instead of

```
expenditure came to \$2000.00
```

- You may have missed the end of a mathematics environment, or you may have a paragraph break within an in-line or displayed maths environment, where it is not permitted. Make sure you don't have any blank lines within the environment. If you want a blank line in your code to make it easier to edit, try having a percent sign at the start of an empty line to ensure that the line is ignored by \LaTeX. For example:

```
\begin{equation}
\%
E = mc^2
\%
\end{equation}
```
B.21 Missing $\begin{document}$

You have put some text outside of the document environment. Check the following:

- You have remembered $\begin{document}$

  This error would be caused by, say,

  \begin{verbatim}
\documentclass{scrartcl}
  \end{verbatim}

  This is a simple document

  instead of

  \begin{verbatim}
\documentclass{scrartcl}
\begin{document}
  \end{verbatim}

  This is a simple document.

- You haven’t placed any text before $\begin{document}$. For example:

  \begin{verbatim}
\documentclass{scrartcl}
  \end{verbatim}

  This is a simple document

  \begin{verbatim}
\begin{document}
  \end{verbatim}

  This is a simple document

  instead of

  \begin{verbatim}
\documentclass{scrartcl}
\begin{document}
  \end{verbatim}

  This is a simple document

- You haven’t missed out the backslash at the start of either $\documentclass$ or $\begin{document}$

  This error would be caused by, say,

  \begin{verbatim}
\documentclass{scrartcl}
  \end{verbatim}

  instead of

  \begin{verbatim}
\documentclass{scrartcl}
  \end{verbatim}

B.22 Missing delimiter

You have forgotten to specify the type of delimiter you want (for example, ( ) [ ] \ { }). (Remember to use a \ if you want an invisible delimiter, and remember that if you want a curly brace, you must have a backslash followed by the curly brace.)
Example:
This error will occur if you do, say,

\[
f(x) = \begin{cases} 
0 & x \leq 0 \\
1 & x > 1 
\end{cases}
\]

instead of

\[
f(x) = \begin{cases} 
0 & x \leq 0 \\
1 & x > 1 
\end{cases}
\]

B.23 Missing \endcsname inserted

This is a \TeX error rather than a \LaTeX error which makes it harder to determine the cause, however it can be caused by placing a backslash in front of the name of an environment. (Remember that environment names do not contain a backslash.)

This error will be caused by, say,

\[
\begin{sffamily}
\end{sffamily}
\]

instead of

\[
\begin{sffamily}
\end{sffamily}
\]

B.24 Missing \endgroup inserted

A number of things could have caused this. You may have missed out the end of an environment, or you may have an environment inside of another environment it’s not allowed to be in. For example, this error can be caused by placing an \texttt{eqnarray} environment inside a \texttt{displaymath} environment, which is not allowed. (But, of course, you haven’t used either of those obsolete environments \cite{15}, have you?)

B.25 Missing number, treated as zero

\LaTeX is expecting a number. If your command takes more than one argument, check to make sure the arguments are in the correct order. For example, if you are using a \texttt{minipage} environment, you might have omitted the \texttt{mandatory argument} which specifies the width of the minipage, or you
may have the \textbf{optional arguments} the wrong way round. The placement specifier should come first, followed by the height.

If you are using \texttt{\addtocounter} or \texttt{\setcounter} remember that the second argument must be a number, so if you want the value of a counter as the argument you must use \texttt{\value}. This error can be caused by, say,

\begin{itemize}
\item \texttt{\setcounter\{exercise\}\{chapter\}} \xmark
\item \texttt{\setcounter\{exercise\}\{\value\{chapter\}\}} \checkmark
\end{itemize}

\section*{B.26 Paragraph ended before \texttt{\begin} was complete}

You’ve probably missed a closing brace at the end of the argument to \texttt{\begin}. This error will be caused by, say,

\begin{itemize}
\item \texttt{\begin\{document\}} \xmark
\item \texttt{\begin\{document\}} \checkmark
\end{itemize}

\section*{B.27 Runaway argument}

There are a number of possible causes of this error:

\begin{itemize}
\item Paragraph breaks are not permitted in the \texttt{arguments} of short commands. If there is a corresponding \texttt{environment} then you should use that instead. For example, this error message will be generated by doing, say,

\begin{itemize}
\item \texttt{\textbf\{This is a simple document. Here is the first paragraph.}} \xmark
\item \texttt{\begin\{bfseries\}This is a simple document. Here is the first paragraph.} \checkmark
\end{itemize}

\item The closing brace of a \texttt{mandatory argument} is missing: This error will be caused by, say,

\begin{itemize}
\item \texttt{\begin\{bfseries\}This is a simple document. Here is the first paragraph.} \checkmark
\item \texttt{\end\{bfseries\}}
\end{itemize}
\end{itemize}
This error can also be caused by omitting the mandatory argument of an environment. For example, this error will occur if you do, say,

\begin{thebibliography}
\bibitem{kopka95} A Guide to \LaTeXe
\end{thebibliography}

instead of

\begin{thebibliography}{1}
\bibitem{kopka95} A Guide to \LaTeXe
\end{thebibliography}

B.28 Something’s wrong—perhaps a missing \item

You may have missed an \item command. The first object in a list environment must either be an \item command, or another list environment.

This error will be caused by, say,

\begin{itemize}
\item Animal
\item Vegetable
\item Mineral
\end{itemize}

instead of

\begin{itemize}
\item Animal
\item Vegetable
\item Mineral
\end{itemize}

This error can also be caused by a missing \bibitem in the bibliography. For example, the error will occur if you do, say,

\begin{thebibliography}{1}
A Guide to \LaTeXe
\end{thebibliography}

instead of

\begin{thebibliography}{1}
\bibitem{kopka95} A Guide to \LaTeXe
\end{thebibliography}

See also UK FAQ [18] entry: Perhaps a missing \item?.
B.29 There’s no line here to end

You have placed a line breaking command (such as \\
\newline or \linebreak) where it doesn’t make sense to have one.

B.30 Undefined control sequence

\LaTeX{} doesn’t understand the command you have used.

- Check to see if you have misspelt the command name (remember that all \LaTeX{} command names are case-sensitive.)
  You will get this error if you do, say,

  This is a simple $\LaTeX$ document

  instead of

  This is a simple $\LaTeX$ document

- Check that you have remembered the space when typing $\backslash$ (backslash space). For example, this error will occur if you do, say,

  This is a $\LaTeX$ sample document.

  instead of

  This is a $\LaTeX$ sample document

- If you are using a command that is defined in a package make sure you have included the package using $\usepackage$.

- Check that your command name hasn’t run into the next piece of text. For example, you can do

  man\oe{}uvre

  or

  man\oe uvre

  or (not recommended)

  man\oe uvre

  but not

  man\oeuvre
Check if you have used a backslash instead of a forward slash as a directory divider. (Remember that when using \LaTeX under Windows, you need to use a forward slash (/) as the directory divider, as a backslash would be interpreted as a command.)

For example, suppose you have a file called shapes.pdf in a subdirectory called pictures, then you would get an error if you did

\includegraphics{pictures\shapes}

instead of

\includegraphics{pictures/shapes}

B.31 You can’t use ‘macro parameter character #’ in horizontal mode

You have used the special character # where you shouldn’t have. Recall from Section 4.3 that if you want a # sign to appear you need to do \# not just #.

This error message will be caused by doing, say,

Item #1

instead of

Item \#1
Appendix C

Need More Help?

First, try to find your query in the UK FAQ [18]. TUG [16] also has a list of useful resources at http://tug.org/interest.html. If you’re still stuck, you can post your question on a (La)TeX forum, newsgroup or mailing list, such as those listed below. If you do post a question, remember you’re asking people who only have an altruistic interest in helping. No one is paying them to help you. Most of the class files and packages were written for free by people who had a need to solve a particular problem and decided to make their work publicly available. So no matter how frustrated you’re feeling, stick to being polite. If you can’t work out how to use a particular class or package, don’t start by heaping offensive, unconstructive criticism on it as there’s a chance the author will read the message. There’s no sense in alienating the person most qualified to answer your question. In your message, stick to the following guidelines:

1. Cut to the chase. In other words, be concise about the nature of the problem. Don’t write lots of long-winded paragraphs.

2. Provide a minimal example C.1 that illustrates the problem.

Example:
I’m trying to use the \foo command in the "bar" package, but I’m getting the following error message:
! Undefined control sequence.
1.4 \foo

Here’s a minimal example:
\documentclass{scartcl}
\usepackage{bar}
\begin{document}
\foo{Blah}
\end{document}

I’m using bar version 1.0 (2012/06/30).

Another example:
I’m using the \foo command in the "bar" package. According to the documentation, this command should display its argument

C.1 see http://www.dickimaw-books.com/latex/minexample/
in a bold font, but it's coming out in italic instead. Anyone know why?

Here's a minimal example:
\documentclass{scrartcl}
\usepackage{bar}
\begin{document}
\foo{Blah}
\end{document}

I'm using bar version 1.1 (2012/07/30).

There's no guarantee that you will get an answer, but if you follow the above guidelines, you will increase your chances.

**Resources**

- The \LaTeX{} Community ([http://www.latex-community.org/](http://www.latex-community.org/)).
- \TeX{/}\LaTeX{} on StackExchange ([http://tex.stackexchange.com/](http://tex.stackexchange.com/)).
- `comp.text.tex` newsgroup (use a newsreader rather than the Google interface if you want to avoid the spam).
- `texhax` archives.

I strongly recommend that you also have a look at the On-Line Catalogue [21]. It's also a good idea to look at the documentation that was installed with your \TeX{/}\LaTeX{} distribution (see Section 1.1). If you are using MiKTeX you can access the on-line help via the Start Menu:

```
Start→ Programs → MiKTeX → Help
```

(Please don't send your problems to me, unless you want to hire a consultant. I read both the \LaTeX{} Community Forum and `comp.text.tex` and answer relevant questions if I have time, but it clogs up my inbox if people keep sending attachments that are in the order of several megabytes in size.) Besides, you'll reach a wide group of experts if you post to a newsgroup, forum or mailing list, rather than a single busy individual.

Commands or environments defined in the \LaTeX kernel are always available.

### Symbols

\begin{itemize}
  \item ![1) Used in \texttt{\hspace{0.25em}\texttt{\textbackslash resizebox}} to maintain aspect ratio [§6.1]; 2) Exclamation symbol (end of sentence marker) [§2.13].]
  \item ![Defined in: \LaTeX Kernel. Upside-down exclamation mark ¡ symbol. See also \texttt{\textbackslash textexclamdown}. [§4.3]
  \item ![A visual indication of a space in the code. When you type up the code, replace all instances of this symbol with a space via the space bar on your keyboard. [§2.0]
  \item ![Defined in: \LaTeX Kernel. Replacement text for argument ⟨\texttt{\langle digit⟩}\rangle. [§8.0]
  \item ![Defined in: \LaTeX Kernel. Switches in and out of in-line math mode. [§9.1]
  \item ![Defined in: \LaTeX Kernel. Comment character used to ignore everything up to and including the newline character in the source code. [§2.0]
  \item ![Defined in: \LaTeX Kernel. Alignment tab. [§4.6]
  \item ![Defined in: \LaTeX Kernel. Closing quote or apostrophe ’ symbol in text mode or prime symbol ’ in math mode. See also \texttt{\textbackslash textquotedblright}. [§4.3]
  \item ![Defined in: \LaTeX Kernel. Closing double quote ” symbol in text mode or double prime ” in math mode. See also \texttt{\textbackslash textquatedblright}. [§4.3]
  \item ![Defined in: \LaTeX Kernel. Opening parenthesis in text mode or left round bracket delimiter in math mode. [§9.4]
\end{itemize}
Defined in: \LaTeX{} Kernel.
Closing parenthesis in text mode or right round bracket delimiter in math mode. [§9.4]

- Defined in: \LaTeX{} Kernel.
Hyphen - in text mode or minus sign – in math mode. [§4.3]

-- Defined in: \LaTeX{} Kernel.
En-dash – symbol. (Normally used for number ranges.) See also \textendash{} [§4.3]

--- Defined in: \LaTeX{} Kernel.
Em-dash — symbol. (Normally used to indicate omissions or interruptions or to highlight a parenthetical element.) See also \textemdash{} [§4.3]

. Defined in: \LaTeX{} Kernel.
1) invisible delimiter [§9.4]; 2) period (full stop) or decimal point [§2.13].

/ Defined in: \LaTeX{} Kernel.
1) Forward slash delimiter (math mode) [§9.4]; 2) Directory divider [§6.0]; 3) Forward slash symbol (see also \textbackslash{}slash) [§2.0].

< Defined in: \LaTeX{} Kernel (Math Mode).
Less than symbol. (Use \textless{} in text mode.) [§4.3]

>{⟨decl⟩}
Defined in: array package.
Used in \texttt{tabular} or \texttt{array} column specifiers after \texttt{l}, \texttt{r}, \texttt{c}, \texttt{p}, \texttt{m} or \texttt{b} to insert ⟨\texttt{decl}⟩ directly after the entry for that column. [§4.6]

> Defined in: \LaTeX{} Kernel (Math Mode).
Greater than symbol. (Use \textgreater{} in text mode.) [§4.3]

>{⟨decl⟩}
Defined in: array package.
Used in \texttt{tabular} or \texttt{array} column specifiers before \texttt{l}, \texttt{r}, \texttt{c}, \texttt{p}, \texttt{m} or \texttt{b} to insert ⟨\texttt{decl}⟩ directly in front of the entry for that column. [§4.6]

? Defined in: \LaTeX{} Kernel.
Question mark (end of sentence marker). [§2.13]

?‘ Defined in: \LaTeX{} Kernel.
Upside-down question mark ¿ symbol. See also \textquestiondown{} [§4.3]

@⟨⟨text⟩⟩ Defined in: \LaTeX{} Kernel.
Used in the argument of \texttt{tabular} or \texttt{array} like environments to specify text to insert between columns. [§4.6]
\[
\text{Defined in: } \LaTeX \text{ Kernel.}
\]
1) Left square bracket delimiter in math mode §9.4; 2) Open delimiter of an optional argument §2.8; 3) Open square bracket in text mode §4.4.

\&
\text{Defined in: } \LaTeX \text{ Kernel.}
Ampersand & symbol §4.3

\$
\text{Defined in: } \LaTeX \text{ Kernel.}
Dollar $ symbol. §4.3

\#
\text{Defined in: } \LaTeX \text{ Kernel.}
Hash # symbol. §4.3

\%
\text{Defined in: } \LaTeX \text{ Kernel.}
Percent % symbol §4.3

\!
\text{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Negative thin space. §9.4

\"{(c)}
\text{Defined in: } \LaTeX \text{ Kernel.}
Umlaut over ⟨c⟩. Example: \"{o} produces ö. §4.3

\'{(c)}
\text{Defined in: } \LaTeX \text{ Kernel.}
Acute accent over ⟨c⟩. Example: \'{o} produces ó. §4.3

\(\)
\text{Defined in: } \LaTeX \text{ Kernel.}
Equivalent to \begin{math}. §9.1

\)
\text{Defined in: } \LaTeX \text{ Kernel.}
Equivalent to \end{math}. §9.1

\,
\text{Defined in: } \LaTeX \text{ Kernel.}
Thin space. §9.4

\-
\text{Defined in: } \LaTeX \text{ Kernel.}
Insert discretionary hyphen. §2.14

\.{(c)}
\text{Defined in: } \LaTeX \text{ Kernel.}
Dot over ⟨c⟩. Example: \.{o} produces ˙o. §4.3

\/
\text{Defined in: } \LaTeX \text{ Kernel.}
Italic correction. §4.5

\:
\text{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Medium space. §9.4
\;

**Defined in:** \LaTeX{} Kernel (Math Mode).

Thick space. [§9.4]

\={\langle c\rangle}

**Defined in:** \LaTeX{} Kernel.

Macron accent over \langle c\rangle. Example: \={o} produces ô. [§4.3]

\@

**Defined in:** \LaTeX{} Kernel.

Used when a sentence ends with a capital letter. This command should be placed after the letter and before the punctuation mark. [§2.13]

\[

**Defined in:** \LaTeX{} Kernel (inconsistency corrected in amsmath).

Starts an unnumbered single-line of displayed maths. [§9.2]

\[
\langle \text{height} \rangle

**Defined in:** \LaTeX{} Kernel.

[§B.10] 1) Breaks a line without justification (**starred form** forbids a page break) [§2.8]; 2) Starts a new row in tabular-style environments [§4.6].

\_

**Defined in:** \LaTeX{} Kernel.

Underscore _ symbol (see also \textunderscore). [§4.3]

\'{c}

**Defined in:** \LaTeX{} Kernel.

Grave accent over \langle c\rangle. Example: \'{o} produces ô. [§4.3]

\{

**Defined in:** \LaTeX{} Kernel.

Left brace { character. In math mode may be used as a delimiter. [§4.3]

\}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Double vertical bar || delimiter [§9.4]

\}

**Defined in:** \LaTeX{} Kernel.

Right brace } character. In math mode may be used as a delimiter. [§4.3]
\~\{c\}

**Defined in:** \LaTeX{} Kernel.

Tilde accent over \{c\}. Example: \~\{o\} produces ô. [§4.3]

}

**Defined in:** \LaTeX{} Kernel.

1) Right square bracket delimiter in math mode [§9.4]; 2) Closing delimiter of an optional argument [§2.8]; 3) Closing square bracket in text mode [§4.4].

^\{\textit{maths}\}\}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Displays its argument as a superscript. [§9.4]

_\{\textit{maths}\}_

**Defined in:** \LaTeX{} Kernel (Math Mode).

Displays its argument as a subscript. [§9.4]

'

**Defined in:** \LaTeX{} Kernel.

Open quote ‘ symbol. See also \textquoteleft. [§4.3]

''

**Defined in:** \LaTeX{} Kernel.

Open double quote “ symbol. See also \textquotedblleft. [§4.3]

\begin{abstract}

**Defined in:** Most article- or report-style classes, such as scrartcl or scrreprt. Not usually defined in book-style classes, such as scrbook, but is defined in memoir.

Displays its contents as an abstract. [§5.2]

\abstractname

**Defined in:** Classes or packages that define an abstract environment.

Text used in abstract heading. [§8.2]
\addcontentsline{toc}{section unit}{(text)}

**Defined in:** \LaTeX{} Kernel.

Adds a sectional unit header to the contents list. [§5.4]

\addto{(command)}{(code)}

**Defined in:** babel package.

Adds \texttt{\textlangle code\textrangle} to the definition of \texttt{\textlangle command\textrangle}. (See also \texttt{\textbackslash appto}) [§8.2]

\addtocounter{(counter)}{(increment)}

**Defined in:** \LaTeX{} Kernel.

Increments the value of a counter by the given amount. [§11.0]

\addtokomafont{(element name)}{(commands)}

**Defined in:** scrartcl, scrreprt and scrbook classes.

Sets the font characteristics for the given KOMA-Script element. [§5.3]

\addtolength{(register)}{(dimension)}

**Defined in:** \LaTeX{} Kernel.

Adds \texttt{\textlangle dimension\textrangle} to the value of the given length register. [§2.17]

\AE

**Defined in:** \LaTeX{} Kernel.

\textAE ligature. [§4.3]

\ae

**Defined in:** \LaTeX{} Kernel.

\textae ligature. [§4.3]

\Amalg

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator II symbol. [§9.4]

\And

**Defined in:** \LaTeX{} Kernel.

Used to separate authors in \texttt{\textbackslash author} [§5.1]

\appendix

**Defined in:** Most classes that have the concept of document structure.
Indicates (but doesn’t print anything) that the document is switching to the appendices. If
chapters exist, the chapter numbering is reset and switched to a different format (usually upper case letters) otherwise the section numbering is reset and switched to a different format. [§5.3]

\appendixname
**Defined in:** Classes or packages that define chapters.
Number prefix used in appendix headings. [§8.2]

\approx
**Defined in:** \LaTeX{} Kernel (Math Mode).
Relational \(\approx\) symbol. [§9.4]

\appto{⟨command⟩}{⟨code⟩}
**Defined in:** etoolbox package.
Adds ⟨code⟩ to the definition of ⟨command⟩. [§8.2]

\arabic{⟨counter⟩}
**Defined in:** \LaTeX{} Kernel.
Displays counter value as an Arabic number. \(1, 2, 3, \ldots\) [§11.0]

\arccos
**Defined in:** \LaTeX{} Kernel (Math Mode).
Typesets \text{arccos} function name. [§9.4]

\arcsin
**Defined in:** \LaTeX{} Kernel (Math Mode).
Typesets \text{arcsin} function name. [§9.4]

\arctan
**Defined in:** \LaTeX{} Kernel (Math Mode).
Typesets \text{arctan} function name. [§9.4]

\arg
**Defined in:** \LaTeX{} Kernel (Math Mode).
Typesets \text{arg} function name. [§9.4]

\begin{array}{⟨v-pos⟩}{⟨column specifiers⟩}
**Defined in:** \LaTeX{} Kernel (Math Mode).
Environment for lining things up in rows and columns. Use \texttt{tabular} for text mode. [§9.4]

\arraycolsep
**Defined in:** \LaTeX{} Kernel.
Length register specifying half the gap between columns in an \texttt{array} environment. [§9.4]

\ast
**Defined in:** \LaTeX{} Kernel (Math Mode).
Binary operator \(\ast\) symbol. [§9.4]

\asymp
**Defined in:** \LaTeX{} Kernel (Math Mode).
Relational \(\asymp\) symbol. [§9.4]
\author{(name)}

**Defined in:** Most classes that have the concept of a title page.

Specifies the document author (or authors). This command doesn’t display any text so may be used in the preamble, but if it’s not in the preamble it must be placed before \maketitle. [§5.1]

B

\b{(c)}

**Defined in:** \LaTeX{} Kernel.

Bar under \langle c \rangle. Example: \b{r} produces r. [§4.3]

\backmatter

**Defined in:** Most book-style classes, such as scrbook.

Suppresses chapter and section numbering, but still adds unstarred sectional units to the table of contents. (See also \frontmatter and \mainmatter.) [§5.7]

\backslash

**Defined in:** \LaTeX{} Kernel (Math Mode).

Backslash \ symbol, which may be used as a delimiter. (Use \textbackslash{} for text mode.) [§9.4]

\baselineskip

**Defined in:** \LaTeX{} Kernel.

A length register that stores the current interline spacing. This is recalculated whenever the font changes. [§10.0]

\begin{(env-name)}[(env-option)]{(env-arg-1)}...{(env-arg-n)}\end{}

**Defined in:** \LaTeX{} Kernel.

Starts an environment. (Must have a matching \end.) [§2.15]

\beta

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case beta β. [§9.4]

\bfseries

**Defined in:** \LaTeX{} Kernel.

Switches to the bold weight in the current font family. [§4.5]

\begin{bfseries}

**Defined in:** \LaTeX{} Kernel.

Typesets the environment contents in a bold font. [§2.15]

\bibitem[{⟨tag⟩}{⟨key⟩}]

**Defined in:** \LaTeX{} Kernel.

Indicates the start of a new reference in the bibliography. May only be used inside the contents of the bibliography environment [§5.6]

\bibname

**Defined in:** Report or book style classes that define a bibliography chapter.

Text used for bibliography chapter heading. (See also \refname.) [§8.2]

\bigcap

**Defined in:** \LaTeX{} Kernel (Math Mode).
Collection intersection $\bigcap$ symbol (may take limits). [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcup}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Collection union $\bigcup$ symbol (may take limits). [§9.4]

\texttt{\textbackslash Bigl\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Left delimiter sizing. [§9.4]

\texttt{\textbackslash Bigl\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Left delimiter sizing. [§9.4]

\texttt{\textbackslash Bigg\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Right delimiter sizing. [§9.4]

\texttt{\textbackslash Bigg\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Right delimiter sizing. [§9.4]

\texttt{\textbackslash Biggl\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Right delimiter sizing. [§9.4]

\texttt{\textbackslash Biggl\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Right delimiter sizing. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigdot}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Big operator $\bigdot$ (may take limits). [§9.4]

\texttt{\textbackslash bigoplus}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Big operator $\bigoplus$ (may take limits). [§9.4]

\texttt{\textbackslash bigotimes}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Big operator $\bigotimes$ (may take limits). [§9.4]

\texttt{\textbackslash Bigr\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Right delimiter sizing. [§9.4]

\texttt{\textbackslash Bigr\{delimiter\}}

**Defined in:** amsmath package (Math Mode).

Right delimiter sizing. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]

\texttt{\textbackslash bigcirc}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator $\bigcirc$ symbol. [§9.4]
\texttt{\bigtriangledown} \hfill \textbf{Symbols} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Binary operator $\triangledown$ symbol. \cite{9.4}

\texttt{\bigtriangleup} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Binary operator $\triangle$ symbol. \cite{9.4}

\texttt{\biguplus} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Big operator $\uplus$ (may take limits). \cite{9.4}

\texttt{\bigvee} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Big operator $\lor$ (may take limits). \cite{9.4}

\texttt{\bigwedge} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Big operator $\land$ (may take limits). \cite{9.4}

\texttt{\begin{Bmatrix}} \\
\textbf{Defined in:} amsmath package (Math Mode).
Like the \texttt{array} environment, but doesn’t have an argument and adds square bracket delimiters. \cite{9.4}

\texttt{\begin{bmatrix}} \\
\textbf{Defined in:} amsmath package (Math Mode).
Like the \texttt{array} environment, but doesn’t have an argument and adds square bracket delimiters. \cite{9.4}

\texttt{\bmod} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Modulo operator. \cite{9.4}

\texttt{\textbf{\textbackslash boldsymbol\{\textit{symbol}\}}}
\textbf{Defined in:} amsmath package (Math Mode).
Like \texttt{\textbf{\textbackslash mathbf}} but also works for numbers and many nonalphabetical symbols. (See also \texttt{\textbf{\textbackslash pmb}}.) \cite{9.4}

\texttt{\textbackslash bottomrule\{\textit{wd}\}} \\
\textbf{Defined in:} booktabs package.
Horizontal rule for the bottom of a \texttt{tabular} environment. \cite{4.6}

\texttt{\bowtie} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Relational $\bowtie$ symbol. \cite{9.4}

\texttt{\bullet} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Binary operator $\bullet$ symbol. \cite{9.4}

\texttt{\textbackslash c\{\textit{c}\}} \\
\textbf{Defined in:} \LaTeX\ Kernel.
Cedilla under \langle c\rangle. Example: $\texttt{\textbackslash c\{o\}}$ produces $\acute{o}$. \cite{4.3}

\texttt{\textbackslash cap} \\
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Binary operator \( \cap \) symbol. \[§9.4\]

\caption{⟨short caption⟩}{⟨caption text⟩}

**Defined in:** \LaTeX\ Kernel.

Inserts the caption for a float such as a figure or table. This **command has a moving argument.** \[§7.0\]

\captionsetup{⟨float type⟩}{⟨options⟩}

**Defined in:** caption package.

Used to set up the options affecting float captions. \[§7.4\]

\begin{cases}
\end{cases}

**Defined in:** amsmath package (Math Mode).

Like the `array` environment, but adds a left brace start delimiter and an invisible end delimiter. \[§9.4\]

\cdot

**Defined in:** \LaTeX\ Kernel (Math Mode).

Centred dot \( \cdot \) symbol. \[§9.4\]

\cdots

**Defined in:** \LaTeX\ Kernel (Math Mode).

Centred ellipses \( \cdots \) symbol. \[§9.4\]

\centering

**Defined in:** \LaTeX\ Kernel.

Switches the paragraph alignment to centred. \[§2.12\]

\cfrac{⟨pos⟩}{⟨numerator⟩}{⟨denominator⟩}

**Defined in:** amsmath (Math Mode).

Displays a continued fraction. \[§9.4\]

\chapter{⟨short title⟩}{⟨title⟩}

**Defined in:** Book-style classes (such as `scrbook` or `scrlspt`) that have the concept of chapters.

Inserts a chapter heading. This **command has a moving argument.** \[§5.3\]

\chaptername

**Defined in:** Classes or packages that define chapters.

Number prefix used in chapter headings. \[§8.2\]

\chi

**Defined in:** \LaTeX\ Kernel (Math Mode).

Greek lower case \( \chi \). \[§9.4\]

\circ

**Defined in:** \LaTeX\ Kernel (Math Mode).

Circle \( \circ \) symbol. \[§9.4\]

\cite{⟨text⟩}{⟨key list⟩}

**Defined in:** \LaTeX\ Kernel.

Inserts the citation markers of each reference identified in the key list. A second run is required to ensure the reference is correct. \[§5.6\]

\color{⟨model⟩}{⟨specs⟩}

**Defined in:** color and xcolor packages.
A declaration that switches the current foreground colour to the given specification. [§8.0]

\cong
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Relational symbol. [§9.4]

\contentsname
\textbf{Defined in:} Classes or packages that define a table of contents.
Text used for table of contents heading. [§8.2]

\coprod
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Co-product symbol (may take limits). [§9.4]

\copyright
\textbf{Defined in:} \LaTeX{} Kernel.
Copyright symbol. [§4.3]

\cos
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Typesets \cos function name. [§9.4]

\cosh
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Typesets \cosh function name. [§9.4]

\cot
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Typesets \cot function name. [§9.4]

\coth
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Typesets coth function name. [§9.4]

\csc
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Typesets \csc function name. [§9.4]

\cup
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Operator symbol. [§9.4]

\currenttime
\textbf{Defined in:} \texttt{datetime} package.
Inserts into the output file the time when the \LaTeX{} application created it from the source code. [§4.2]

\d{\langle c \rangle}
\textbf{Defined in:} \LaTeX{} Kernel.
Dot under \langle c \rangle. Example: \texttt{d\{o\}} produces \( o \). [§4.3]

\dag
\textbf{Defined in:} \LaTeX{} Kernel.
Dagger symbol. [§4.3]

\dagger
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Binary operator symbol. [§9.4]

\dashv
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Relational \( \vdash \) symbol. [§9.4]

\begin{verbatim}
\date{⟨text⟩}
\end{verbatim}

**Defined in:** Most classes that have the concept of a title page.

Specifies the document date. This command doesn’t display any text so may be used in the preamble, but if it’s not in the preamble it must be placed before \maketitle. If omitted, most classes assume the current date (as provided by \today). [§5.1]

\begin{verbatim}
\ddag
\end{verbatim}

**Defined in:** \LaTeX{} Kernel.

Double-dagger ‡ symbol. [§4.3]

\begin{verbatim}
\ddagger
\end{verbatim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator ‡ symbol. [§9.4]

\begin{verbatim}
\ddmmyyyydate
\end{verbatim}

**Defined in:** \texttt{datetime} package.

Changes the format of \today so that it displays the date in the form 09/02/2014 (day/month/year in digits). [§4.2]

\begin{verbatim}
\ddots
\end{verbatim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Diagonal ellipses ⋮ symbol. [§9.4]

\begin{verbatim}
\DeclareGraphicsExtensions{⟨ext-list⟩}
\end{verbatim}

**Defined in:** graphicx package.

Specify the file extensions to look for if no extension is used in \includegraphics [§6.0]

\begin{verbatim}
\DeclareMathOperator{⟨cmd⟩}{⟨operator-name⟩}
\end{verbatim}

**Defined in:** \texttt{amsmath} package (Preamble Only).

Defines a new maths operator. The starred version allows limits. [§9.4]

\begin{verbatim}
\deg
\end{verbatim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \texttt{deg} function name. [§9.4]

\begin{verbatim}
\Delta
\end{verbatim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek upper case delta \( \Delta \). [§9.4]

\begin{verbatim}
\delta
\end{verbatim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case delta \( \delta \). [§9.4]

\begin{verbatim}
\begin{description}
\end{verbatim}

**Defined in:** Most class files.

Labelled list. [§4.4]

\begin{verbatim}
\det
\end{verbatim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \texttt{det} function name (may have limits via _ or ^). [§9.4]
\texttt{\textbackslash diamond}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator \( \diamond \) symbol. \[§9.4\]

\texttt{\textbackslash dim}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \texttt{\textbackslash dim} function name. \[§9.4\]

\texttt{\textbackslash ding\{⟨n⟩\}}

**Defined in:** \texttt{pifont} package.

Inserts PostScript ZapfDingbats character with code \( ⟨n⟩ \), which must be an integer. \[§8.2\]

\texttt{\textbackslash begin\{dinglist\}\{⟨number⟩\}}

**Defined in:** \texttt{pifont} package.

A list where the item marker is given by character \( ⟨\text{number}⟩ \) in the Zapf Dingbats font. \[§8.2\]

\texttt{\textbackslash displaybreak\{⟨n⟩\}}

**Defined in:** \texttt{amsmath} package.

Allows a page break in multi-lined maths environments, such as \texttt{align}. \[§9.3\]

\texttt{\textbackslash div}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Division operator \( \div \) symbol. \[§9.4\]

\texttt{\textbackslash documentclass\{⟨option-list⟩\} \{⟨class-name⟩\}}

**Defined in:** \LaTeX{} Kernel.

Loads the document class file, which sets up the type of document you wish to write. \[§4.0\]

\texttt{\textbackslash doteq}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \( \doteq \) symbol. \[§9.4\]

\texttt{\textbackslash dotsb}

**Defined in:** \texttt{amsmath} (Math Mode).

Ellipses \( \ldots \) for dots with binary operators/relations. \[§9.4\]

\texttt{\textbackslash dotsc}

**Defined in:** \texttt{amsmath} (Math Mode).

Ellipses \( \ldots \) for dots with commas. \[§9.4\]

\texttt{\textbackslash dotsi}

**Defined in:** \texttt{amsmath} (Math Mode).

Ellipses \( \ldots \) for dots with integrals. \[§9.4\]

\texttt{\textbackslash dotsm}

**Defined in:** \texttt{amsmath} (Math Mode).

Ellipses \( \ldots \) for dots with multiplications. \[§9.4\]

\texttt{\textbackslash dotso}

**Defined in:** \texttt{amsmath} (Math Mode).

Ellipses \( \ldots \) for general dots. \[§9.4\]

\texttt{\textbackslash doublebox\{⟨text⟩\}}

**Defined in:** \texttt{fancybox} package.
Puts a double-lined frame around its contents, prohibiting a line break in the contents. [§4.7]

\Downarrow  
**Defined in:** \LaTeX{} Kernel (Math Mode).
Double-lined down arrow \(\Downarrow\). (May be used as a delimiter.) [§9.4]

\downarrow  
**Defined in:** \LaTeX{} Kernel (Math Mode).
Down arrow \(\downarrow\). (May be used as a delimiter.) [§9.4]

\em  
**Defined in:** \LaTeX{} Kernel.
Toggles the upright and italic/slanted form of the current font family. [§4.5]

\begin{em}  
**Defined in:** \LaTeX{} Kernel.
Typesets the environment contents in an emphasized font. (Switches to italic/slanted if the surrounding font is upright, or switches to upright if the surrounding font is italic/slanted.) [§4.5]

\end{em}  

\textbf{\texttt{\textbackslash em}}  
**Defined in:** \LaTeX{} Kernel.
Toggles the upright and italic/slanted rendering of \langle text\rangle. [§4.5]

\begin{enumerate}  
**Defined in:** \LaTeX{} Kernel.
Ordered list. [§4.4]

\eqref{⟨label⟩}  
**Defined in:** amsmath package.
Short cut for \langle \ref{⟨label⟩}\rangle for referencing equations. [§9.2]

\begin{equation}  
**Defined in:** \LaTeX{} Kernel.
Displays its contents as a single-lined numbered equation. [§9.2]

\equiv  
**Defined in:** \LaTeX{} Kernel (Math Mode).
Relational \(\equiv\) symbol. [§9.4]

\eta  
**Defined in:** \LaTeX{} Kernel (Math Mode).
Greek lower case eta \(\eta\). [§9.4]
\exp
Defined in: \LaTeX{} Kernel (Math Mode).
Typesets \texttt{exp} function name. [§9.4]

F
\familydefault
Defined in: \LaTeX{} Kernel.
Specifies the default font family. Defaults to \texttt{rmdefault} but may be redefined by certain classes. [§8.2]

\fbox{⟨text⟩}
Defined in: \LaTeX{} Kernel.
Puts a frame around its contents, prohibiting a line break in the contents. [§4.7]

\begin{figure}⟨placement⟩\end{figure}
Defined in: Most classes that define sectioning commands.
Floats the contents to the nearest location according to the preferred placement options, if possible. Within the environment, \texttt{\caption} may be used one or more times, as required. The caption will usually include the prefix given by \texttt{\figurename}. [§7.1]

\figurename
Defined in: Classes or packages that define figures.
Number prefix used in figure captions. [§8.2]

\fnsymbol{⟨counter⟩}
Defined in: \LaTeX{} Kernel.
Displays counter value as footnote symbol. (⋆ † ‡ § ¶ || ** †† ‡‡) [§11.0]

\footnote{⟨number⟩}{⟨text⟩}
Defined in: \LaTeX{} Kernel.
Inserts a footnote. [§4.1]

\footnotesize
Defined in: Most document classes.
Switches to footnote sized text. [§4.5]

\forall
Defined in: \LaTeX{} Kernel (Math Mode).
"For all" ∀ symbol. [§9.4]

\foreignlanguage{⟨language name⟩}{⟨text⟩}
Defined in: babel package.
Typesets the given text using any predefined names or date formats supplied by the given language. [§5.8]

\frac{⟨numerator⟩}{⟨denominator⟩}
Defined in: \LaTeX{} Kernel (Math Mode).
Displays a fraction. [§9.4]

\framebox[⟨width⟩]{⟨align⟩}{⟨text⟩}
Defined in: \LaTeX{} Kernel.
Puts a frame around its contents, prohibiting a line break in the contents. [§4.7]

\frenchspacing
Defined in: \LaTeX{} Kernel.
Switch to French spacing. [§2.13]
`\frontmatter`

**Defined in:** Most book-style classes, such as `scrbook`.

Switches to lower case Roman numeral page numbering. Also suppresses chapter and section numbering, but still adds unstarred sectional units to the table of contents. (See also `\mainmatter` and `\backmatter`.) [§5.7]

`\frown`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(\sim\) symbol. [§9.4]

\(G\)

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek upper case gamma \(\Gamma\). [§9.4]

`\Gamma`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case gamma \(\gamma\). [§9.4]

`\gamma`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \(\gcd\) function name (may have limits via \(_\) or \(^\)). [§9.4]

`\gcd`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \(\hom\) function name. [§9.4]

`\hom`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(\ge\) symbol. [§9.4]

`\geq`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(\geq\) symbol. [§9.4]

`\geq`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Left arrow \(\leftarrow\). [§9.4]

`\gets`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(\gg\) symbol. [§9.4]

`\gg`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Double acute diacritic over \(\langle c \rangle\).

Example: \(\H{o}\) produces \(\delta\). [§4.3]

`\H{⟨c⟩}`

**Defined in:** booktabs package.

Length register specifying the thickness of `\toprule` and `\bottomrule`. [§4.6]

`\heavyrulewidth`

**Defined in:** \LaTeX{} Kernel (Math Mode).

H

\(\H{(c)}\)

**Defined in:** \LaTeX{} Kernel.

Double acute diacritic over \(\langle c \rangle\).

Example: \(\H{o}\) produces \(\delta\). [§4.3]

\(\H{⟨c⟩}\)

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \(\hom\) function name. [§9.4]

`\hom`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Hooked left arrow \(\propto\). [§9.4]

`\hookleftarrow`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Hooked left arrow \(\propto\). [§9.4]

`\hookrightarrow`

**Defined in:** \LaTeX{} Kernel (Math Mode).

Symbols

| A | B | C | D | E | F | G | H | I | J | K | L | M | N | O | P | Q | R | S | T | U | V | W | X | Y | Z |
Hooked right arrow $\hookrightarrow$. \[§9.4\]

\hspace{(length)}

**Defined in:** \LaTeX{} Kernel.
Inserts a horizontal gap of the
given width. \[§4.6\]

\Huge

**Defined in:** Most document
classes.
Switches to extra-huge sized text. \[§4.5\]

\huge

**Defined in:** Most document
classes.
Switches to huge sized text. \[§4.5\]

\hyphenation{(word)}

**Defined in:** \LaTeX{} Kernel.
Specifies hyphenation points. \[§2.14\]

\i

**Defined in:** \LaTeX{} Kernel.
Dotless i character: ı. \[§4.3\]

\iflanguage{(language
name)}{(true text)}{(false text)}

**Defined in:** babel package.
Tests the current language. \[§5.8\]

\ignorespaces

**Defined in:** \LaTeX{} Kernel.
Used in begin environment code to
suppress any spaces occurring at
the start of the environment (see
also \ignorespacesafterend). \[§10.0\]

\ignorespacesafterend

**Defined in:** \LaTeX{} Kernel.
Used in end environment code to
suppress any spaces following the
end of the environment. \[§10.0\]

\in

**Defined in:** \LaTeX{} Kernel (Math
Mode).
Relational $\in$ symbol. \[§9.4\]

\includegraphics[(key
vals)]{filename}

**Defined in:** graphicx package.
Inserts a graphics file into the
document. \[§6.0\]

\index{(text)}

**Defined in:** \LaTeX{} Kernel.
Adds indexing information to an
external index file. The command
\makeindex must be used in the
preamble to enable this command.
The external index file must be
post-processed with an indexing
application, such as \makeindex.
\[§8.0\]

\indexname

**Defined in:** Classes or packages
that define an index section.
Text used for index heading. \[§8.2\]

\inf

**Defined in:** \LaTeX{} Kernel (Math
Mode).
Typesets inf function name (may
have limits via _ or ^). \[§9.4\]
\texttt{\infty} \textbf{Defined in}: \LaTeX{} Kernel (Math Mode).
Infinity \(\infty\) symbol. [§9.4]

\texttt{\textbackslash injlim} \textbf{Defined in}: amsmath (Math Mode).
Typesets \texttt{\textbackslash inj lim} function name (may have limits via \texttt{\textunderscore} or \texttt{\textasciicircum}). [§9.4]

\texttt{\textbackslash int} \textbf{Defined in}: \LaTeX{} Kernel (Math Mode).
Integral \(\int\) symbol (may take limits). [§9.4]

\texttt{\textbackslash intertext}{\langle text\rangle} \textbf{Defined in}: amsmath package (Math Mode).
Used for a short interjection in the middle of a multi-line displayed maths, such as in an \texttt{\texttt{\textbackslash align}} environment. May only appear right after \texttt{\textbackslash \}. [§9.3]

\texttt{\textbackslash iota} \textbf{Defined in}: \LaTeX{} Kernel (Math Mode).
Greek lower case iota \(\iota\). [§9.4]

\texttt{\textbackslash item}{\langle marker\rangle} \textbf{Defined in}: \LaTeX{} Kernel.
Specifies the start of an item in a list. (Only allowed inside one of the list making environments.) [§4.4]

\texttt{\textbackslash begin\{itemize\}} \textbf{Defined in}: \LaTeX{} Kernel.
Unordered list. [§4.4]

\texttt{\textbackslash begin\{itshape\}} \textbf{Defined in}: \LaTeX{} Kernel.
Typesets the environment contents in an italic font. [§4.5]

\texttt{\textbackslash itshape} \textbf{Defined in}: \LaTeX{} Kernel.
Switches to the italic form of the current font family, if it exists. [§4.5]

J

\texttt{\textbackslash j} \textbf{Defined in}: \LaTeX{} Kernel.
Dotless j character: \(j\). [§4.3]

K

\texttt{\textbackslash kappa} \textbf{Defined in}: \LaTeX{} Kernel (Math Mode).
Greek lower case kappa \(\kappa\). [§9.4]

\texttt{\textbackslash ker} \textbf{Defined in}: \LaTeX{} Kernel (Math Mode).
Typesets \texttt{\textbackslash ker} function name. [§9.4]

L

\texttt{\textbackslash L} \textbf{Defined in}: \LaTeX{} Kernel.
Upper case L-bar \(Ł\) character. [§4.3]

\texttt{\textbackslash l} \textbf{Defined in}: \LaTeX{} Kernel.
Lower case l-bar \(ł\) character. [§4.3]

\texttt{\textbackslash label}{\langle string\rangle} \textbf{Defined in}: \LaTeX{} Kernel.
Assigns a unique textual label linked to the most recently incremented cross-referencing counter in the current scope (see also \ref). [§5.5]

\labelformat{(ctr)}{(defn)}
\textbf{Defined in:} facylab package.
Defines how the label for the counter \langle ctr \rangle should be formatted. The definition \langle defn \rangle should use \#1 to indicate the label value. [§7.4]

\labelitemi
\textbf{Defined in:} Classes that define the \texttt{itemize} environment.
The default label for the first level \texttt{itemize}. [§8.2]

\labelitemii
\textbf{Defined in:} Classes that define the \texttt{itemize} environment.
The default label for the second level \texttt{itemize}. [§8.2]

\labelitemiii
\textbf{Defined in:} Classes that define the \texttt{itemize} environment.
The default label for the third level \texttt{itemize}. [§8.2]

\labelitemiv
\textbf{Defined in:} Classes that define the \texttt{itemize} environment.
The default label for the fourth level \texttt{itemize}. [§8.2]

\Lambda
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Greek upper case lambda \( \Lambda \). [§9.4]

\lambda
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Greek lower case lambda \( \lambda \). [§9.4]

\langle
\textbf{Defined in:} \LaTeX\ Kernel (Math Mode).
Left-angled \langle delimeter. [§9.4]

\LARGE
\textbf{Defined in:} Most document classes.
Switches to extra-extra-large sized text. [§4.5]

\Large
\textbf{Defined in:} Most document classes.
Switches to extra-large sized text. [§4.5]

\large
\textbf{Defined in:} Most document classes.
Switches to large sized text. [§4.5]

\LaTeX
\textbf{Defined in:} \LaTeX\ Kernel.
Typesets the \LaTeX\ logo. [§2.6]

\LaTeXe
\textbf{Defined in:} \LaTeX\ Kernel.
Typesets the \LaTeX\ 2\epsilon\ logo. [§5.6]
\leftceil
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Left ceil \lceil \text{ delimiter.} [§9.4]

\ldots
Defined in: \LaTeX \text{ Kernel.}
Ellipses \ldots \text{ symbol.} [§4.3]

\le
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Relational \le \text{ symbol.} [§9.4]

\left<\text{delimiter}\>
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Indicates a left stretchable delimiter. Must have a matching \right. [§9.4]

\Leftarrow
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Double-lined left arrow \Leftarrow. [§9.4]

\leq
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Relational \le \text{ symbol.} [§9.4]

\lfloor
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Left floor \lfloor \text{ delimiter.} [§9.4]

\lg
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Typesets \lg \text{ function name.} [§9.4]

\lightrulewidth
\textbf{Defined in: } booktabs package.
\textit{Length} register specifying the thickness of \midrule. [§4.6]

\lim
\textbf{Defined in: } \LaTeX \text{ Kernel (Math Mode).}
Typesets \lim \text{ function name} (may have limits via _ or ^). [§9.4]
\liminf
\textbf{Defined in:} \LaTeX \text{Kernel (Math Mode)}.
Typesets lim inf function name (may have limits via \_ or ^). [§9.4]

\limsup
\textbf{Defined in:} \LaTeX \text{Kernel (Math Mode)}.
Typesets lim sup function name (may have limits via \_ or ^). [§9.4]

\linebreak[(n)]
\textbf{Defined in:} \LaTeX \text{Kernel}.
Requests a line break, ensuring the paragraph remains justified. This may cause excess white space in the paragraph. [§B.29]

\linewidth
\textbf{Defined in:} \LaTeX \text{Kernel}.
A length containing the desired current line width. This is usually the width of the typeblock, but inside a \texttt{minipage} or \texttt{parbox} it will be the width the box. Note that the actual contents of the line may fall short of the line width (underfull hbox) or extend beyond it (overfull hbox). [§4.7]

\listfigurename
\textbf{Defined in:} Classes or packages that define a list of figures.
Text used for list of figures heading. [§8.2]

\listoffigures
\textbf{Defined in:} Most classes that have the concept of document structure.
Inserts the list of figures. A second (possibly third) run is required to ensure the page numbering is correct. [§7.1]

\listoftables
\textbf{Defined in:} Most classes that have the concept of document structure.
Inserts the list of tables. A second (possibly third) run is required to ensure the page numbering is correct. [§7.2]

\listtablename
\textbf{Defined in:} Classes or packages that define a list of tables.
Text used for list of tables heading. [§8.2]

\ll
\textbf{Defined in:} \LaTeX \text{Kernel (Math Mode)}.
Relational ≪ symbol. [§9.4]

\ln
\textbf{Defined in:} \LaTeX \text{Kernel (Math Mode)}.
Typesets ln function name. [§9.4]

\log
\textbf{Defined in:} \LaTeX \text{Kernel (Math Mode)}.
Typesets log function name. [§9.4]

\Longleftarrow
\textbf{Defined in:} \LaTeX \text{Kernel (Math Mode)}.
Long double-lined left arrow \(\ll\). [§9.4]
\longleftarrow
**Defined in:** \LaTeX{} Kernel (Math Mode).
Long left arrow \textendash. [§9.4]

\Longlefttrightarrow
**Defined in:** \LaTeX{} Kernel (Math Mode).
Long double-lined double-ended horizontal arrow \iff. [§9.4]

\longmapsto
**Defined in:** \LaTeX{} Kernel (Math Mode).
Long mapping arrow \mapsto. [§9.4]

\longrightarrow
**Defined in:** \LaTeX{} Kernel (Math Mode).
Long right arrow \implies. [§9.4]

\lVert
**Defined in:** amsmath (Math Mode).
Left double vertical bar | delimiter. [§9.4]

\lvert
**Defined in:** amsmath (Math Mode).
Left vertical bar | delimiter. [§9.4]

\mainmatter
**Defined in:** Most book-style classes, such as \texttt{scrbook}.
Switches to Arabic page numbering and enables chapter and section numbering. (See also \texttt{frontmatter} and \texttt{backmatter}. [§5.7]

\makeindex
**Defined in:** \LaTeX{} Kernel (Preamble Only).
Enables \texttt{index}. [§8.0]

\maketitle
**Defined in:** Most classes that have the concept of a title page.
Generates the title page (or title block). This command is usually placed at the beginning of the document environment. [§5.1]

\mapsto
**Defined in:** \LaTeX{} Kernel (Math Mode).
Mapping arrow \mapsto. [§9.4]

\markboth{⟨left head⟩}{⟨right head⟩}
**Defined in:** \LaTeX{} Kernel.
Specifies information for the left and right page headers. Not all page styles use this information, in which case the arguments are ignored. [§5.7]
\markright{(right head)}

**Defined in:** \LaTeX{} Kernel.

Specifies information for the right (odd) page header. Not all page styles use this information, in which case the argument is ignored. \footnote{§5.7}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Like the \texttt{array} environment, but doesn't have an argument. \footnote{§9.4}

\begin{equation}
\max
\end{equation}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets max function name (may have limits via _ or ^). \footnote{§9.4}

\textbf{Symbols}

\begin{tabular}{llll}
A & B & C & D \\
E & F & G & H \\
I & J & K & L \\
M & N & O & P \\
Q & R & S & T \\
U & V & W & X \\
Y & Z \\
\end{tabular}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths bold font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths italic font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths sans-serif font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths typewriter font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths serif font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets \langle \texttt{maths} \rangle in the predefined maths calligraphic font. Example: \texttt{\mathcal{S}} \texttt{\mathcal{S}} produces \texttt{\mathcal{S}}. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets its argument in Euler Fraktur letters. Example: \texttt{\mathfrak{U}} \texttt{\mathfrak{U}} produces \texttt{\mathfrak{U}}. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Sets its contents in in-line math mode. \footnote{§9.1}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** amsfonts package (Math Mode).

Typesets its argument in the blackboard bold font. Example: \texttt{\mathbb{R}} \texttt{\mathbb{R}} produces \texttt{\mathbb{R}}. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths bold font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths italic font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets its argument in Euler Fraktur letters. Example: \texttt{\mathfrak{U}} \texttt{\mathfrak{U}} produces \texttt{\mathfrak{U}}. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths italic font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths bold font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths serif font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths serif font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths serif font. \footnote{§9.4}

\begin{math}
\begin{matrix}
\end{matrix}
\end{math}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Renders \langle \texttt{maths} \rangle in the predefined maths serif font. \footnote{§9.4}
\textbf{\texttt{\textbackslash mbox}}{(\textit{text})}

**Defined in:** LaTeX Kernel.
Ensures that the given text doesn't contain a line break. [§4.7]

\textbf{\texttt{\textbackslash mdseries}}

**Defined in:** LaTeX Kernel.
Switches to the medium weight in the current font family. [§4.5]

\textbf{\texttt{\textbackslash medspace}}

**Defined in:** amsmath package.
Medium space. [§9.4]

\textbf{\texttt{\textbackslash mid}}

**Defined in:** LaTeX Kernel (Math Mode).
Relational | symbol. [§9.4]

\textbf{\texttt{\textbackslash midrule}}{(⟨wd⟩)}

**Defined in:** booktabs package.
Horizontal rule to go below headings row of a \texttt{tabular} environment. [§4.6]

\textbf{\texttt{\textbackslash min}}

**Defined in:** LaTeX Kernel (Math Mode).
Typesets min function name (may have limits via \texttt{_} or \texttt{^}). [§9.4]

\textbf{\texttt{\textbackslash begin\{minipage\}}}{⟨\texttt{pos}⟩}

\texttt{⟨height⟩}{⟨\texttt{width}⟩}

**Defined in:** LaTeX Kernel.
Makes a box with line-wrapped contents. (See also \texttt{\textbackslash parbox}) [§4.7]

\textbf{\texttt{\textbackslash minisec}}{⟨\texttt{heading}⟩}

**Defined in:** \texttt{scartcl}, \texttt{scprept} and \texttt{scrbook} classes.
An unnumbered heading not associated with any structuring level. [§5.3]

\textbf{\texttt{\textbackslash mod}}{(\textit{maths})}

**Defined in:** amsmath (Math Mode).
Modulo operator without parentheses. [§9.4]

\textbf{\texttt{\textbackslash models}}

**Defined in:** LaTeX Kernel (Math Mode).
Relational | symbol. [§9.4]

\textbf{\texttt{\textbackslash mp}}

**Defined in:** LaTeX Kernel (Math Mode).
Minus or plus operator \(\mp\) symbol. [§9.4]

\textbf{\texttt{\textbackslash mu}}

**Defined in:** LaTeX Kernel (Math Mode).
Greek lower case mu \(\mu\). [§9.4]

\textbf{\texttt{\textbackslash multicolumn}}{(⟨\texttt{cols}
\texttt{spanned}⟩)}{⟨\texttt{col specifier}⟩}{⟨\texttt{text}⟩}

**Defined in:** LaTeX Kernel.
Spans multiple columns in a \texttt{tabular}-style environment. [§4.6]

\textbf{\texttt{\textbackslash nearrow}}

**Defined in:** LaTeX Kernel (Math Mode).
North-East arrow \(\nearrow\). [§9.4]
\notin

**Defined in:** \LaTeX\ Kernel (Math Mode).

Relational \(\notin\) symbol. [§9.4]

\nu

**Defined in:** \LaTeX\ Kernel (Math Mode).

Greek lower case nu \(\nu\). [§9.4]

\nwarro

**Defined in:** \LaTeX\ Kernel (Math Mode).

North-West arrow \(\n\). [§9.4]

\O

**Defined in:** \LaTeX\ Kernel.

Upper case slashed-O \(\text{o}\) character. [§4.3]

\o

**Defined in:** \LaTeX\ Kernel.

Lower case slashed-o \(\text{o}\) character. [§4.3]

\odot

**Defined in:** \LaTeX\ Kernel (Math Mode).

Operator \(\odot\) symbol. [§9.4]

\OE

**Defined in:** \LaTeX\ Kernel.

CE ligature. [§4.3]

\oe

**Defined in:** \LaTeX\ Kernel.

œ ligature. [§4.3]

\oint

**Defined in:** \LaTeX\ Kernel (Math Mode).

Closed path integral \(\oint\) symbol (may take limits). [§9.4]

\Omega

**Defined in:** \LaTeX\ Kernel (Math Mode).

Greek upper case omega \(\Omega\). [§9.4]

\omega

**Defined in:** \LaTeX\ Kernel (Math Mode).

Greek lower case omega \(\omega\). [§9.4]

\ominus

**Defined in:** \LaTeX\ Kernel (Math Mode).

Operator \(\ominus\) symbol. [§9.4]

\oplus

**Defined in:** \LaTeX\ Kernel (Math Mode).

Operator \(\oplus\) symbol. [§9.4]

\oslash

**Defined in:** \LaTeX\ Kernel (Math Mode).

Operator \(\oslash\) symbol. [§9.4]

\begin{otherlanguage}{⟨language name⟩}

**Defined in:** babel package.

Within the environment contents, predefined textual elements, such as the date given by \today or prefixes like “Chapter”, are set to
those supplied by the given language. [§5.8]

\otimes
Defined in: \LaTeX\ Kernel (Math Mode).
Operator \( \otimes \) symbol. [§9.4]

\ovalbox{\langle text\rangle}
Defined in: fancybox package.
Puts a thick-lined oval frame around its contents, prohibiting a line break in the contents. [§4.7]

\ovalbox{\langle text\rangle}
Defined in: fancybox package.
Puts a thin-lined oval frame around its contents, prohibiting a line break in the contents. [§4.7]

\overleftarrow{\langle maths\rangle}
Defined in: \LaTeX\ Kernel (Math Mode).
Puts an extendible left arrow over \langle maths\rangle [§9.4]

\overleftarrow{\langle maths\rangle}
Defined in: amsmath package (Math Mode).
Puts an extendible left-right arrow over \langle maths\rangle [§9.4]

\overrightarrow{\langle maths\rangle}
Defined in: \LaTeX\ Kernel (Math Mode).
Puts an extendible right arrow over \langle maths\rangle [§9.4]

\parallel
Defined in: \LaTeX\ Kernel (Math Mode).
Relational \( \parallel \) symbol. [§9.4]

\paragraph{\langle short title\rangle}{\langle title\rangle}
Defined in: Most classes that have the concept of document structure.
Inserts a subsubsubsection header. Most classes default to an unnumbered running header for this sectional unit. \textbf{This command has a moving argument.} [§5.3]

\paragraph{}
Defined in: \LaTeX\ Kernel (Math Mode).

\pageref{\langle string\rangle}
Defined in: \LaTeX\ Kernel.
Similar to \ref but inserts the page number where the given label was defined. A second (possibly third) run of \LaTeX\ is required to ensure the cross-references are up-to-date. [§5.5]

\pagestyle{\langle style\rangle}
Defined in: \LaTeX\ Kernel.
Sets the style of the headers and footers. [§5.7]

\par
Defined in: \LaTeX\ Kernel.
Insert a paragraph break. [§4.0]

\pagenumbering{\langle style\rangle}
Defined in: \LaTeX\ Kernel.
Sets the style of the page numbers. [§5.7]
\parbox{\langle pos\rangle}{\langle height\rangle}{\langle width\rangle}{\langle text\rangle}

**Defined in:** \LaTeX{} Kernel.

Makes a box with line-wrapped contents. (More restrictive than \texttt{minipage}.) \cite{4.7}

\parindent

**Defined in:** \LaTeX{} Kernel.

A \texttt{length} register that stores the indentation at the start of paragraphs. \cite{2.17}

\parskip

**Defined in:** \LaTeX{} Kernel.

A \texttt{length} register that stores the spacing between paragraphs. (If you’re using one of the KOMA-Script classes, use the \texttt{parskip} option to set it to full or half line height.) \cite{2.17}

\part{\langle short title\rangle}{\langle title\rangle}

**Defined in:** Most classes that have the concept of document structure.

Inserts a part sectional unit. \textbf{This command has a moving argument.} \cite{5.3}

\partial

**Defined in:** \LaTeX{} Kernel (Math Mode).

Partial $\partial$ symbol. \cite{9.4}

\perp

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational $\perp$ symbol. \cite{9.4}

\Phi

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek upper case phi $\Phi$. \cite{9.4}

\phi

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case phi $\phi$. \cite{9.4}

\Pi

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek upper case pi $\Pi$. \cite{9.4}

\pi

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case pi $\pi$. \cite{9.4}

\pm

**Defined in:** \LaTeX{} Kernel (Math Mode).

Operator $\pm$ symbol. \cite{9.4}

\begin{pmatrix}

**Defined in:** \texttt{amsmath} package (Math Mode).

Like the \texttt{array} environment, but doesn’t have an argument and adds round bracket delimiters. \cite{9.4}
\texttt{\pmb{⟨symbol⟩}}

**Defined in:** amsmath package (Math Mode).

“Poor man’s bold.” Overlays multiple copies of the symbol to produce a bold effect for symbols that don’t work with \texttt{\boldsymbol}. [§9.4]

\texttt{\pmod{⟨maths⟩}}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Modulo operator with parentheses. [§9.4]

\texttt{\pod{⟨maths⟩}}

**Defined in:** amsmath (Math Mode).

Modulo operator with parentheses but no “mod”. [§9.4]

\texttt{\pounds}

**Defined in:** \LaTeX{} Kernel.

Pound £ symbol. [§4.3]

\texttt{\Pr}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets Pr function name (may have limits via \_ or ^). [§9.4]

\texttt{\prec}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(<\) symbol. [§9.4]

\texttt{\preceq}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(\leq\) symbol. [§9.4]

\texttt{\printindex}

**Defined in:** makeidx package.

Prints the index. Must be used with \texttt{\makeindex} and \texttt{\index}. (The external index file must first be processed by an indexing application.) [§8.0]

\texttt{\prod}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Product \(\prod\) symbol (may take limits). [§9.4]

\texttt{\projlim}

**Defined in:** amsmath (Math Mode).

Typesets proj lim function name (may have limits via \_ or ^). [§9.4]

\texttt{\propto}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \(\propto\) symbol. [§9.4]

\texttt{\protect\{command\}}

**Defined in:** \LaTeX{} Kernel.

Used in a moving argument to prevent a fragile command from expanding. [§2.9]

\texttt{\Psi}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek upper case psi \(\Psi\). [§9.4]

\texttt{\psi}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case psi \(\psi\). [§9.4]
Greek lower case psi \( \psi \). [§9.4]

\texttt{\textbackslash publishers\{(text)\}}

\textbf{Defined in:} \LaTeX{} Kernel, \texttt{scrartcl}, \texttt{scrreprt}, \texttt{scrbook} classes.

Specifies the publisher (typeset after all the other titling information). [§5.1]

\quad Q

\texttt{\textbackslash quad}

\textbf{Defined in:} \LaTeX{} Kernel.

Horizontal spacing command (twice as wide as \texttt{\textbackslash quad}). [§9.4]

\quad \texttt{\textbackslash quad}

\textbf{Defined in:} \LaTeX{} Kernel.

Horizontal spacing command equal to the current font’s \texttt{em} value. [§9.4]

\quad R

\texttt{\textbackslash r\{(c)\}}

\textbf{Defined in:} \LaTeX{} Kernel.

Ring over \( ⟨c⟩ \). Example: \texttt{\textbackslash r\{u\}} produces ũ. [§4.3]

\quad \texttt{\textbackslash raggedleft}

\textbf{Defined in:} \LaTeX{} Kernel.

Ragged-left paragraph justification. [§2.12]

\quad \texttt{\textbackslash raggedright}

\textbf{Defined in:} \LaTeX{} Kernel.

Ragged-right paragraph justification. [§2.12]

\quad \texttt{\textbackslash range}

\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).

Right-angled \(\rangle\) delimiter. [§9.4]

\quad \texttt{\textbackslash rceil}

\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).

Right \(\lceil\) delimiter. [§9.4]

\quad \texttt{\textbackslash ref\{(string)\}}

\textbf{Defined in:} \LaTeX{} Kernel.

References the value of the counter linked to the given label. A second (possibly third) run of \LaTeX{} is required to ensure the cross-references are up-to-date. [§5.5]

\quad \texttt{\textbackslash reflectbox\{(text)\}}

\textbf{Defined in:} \texttt{graphicx} package.

Reflects the specified contents in the \(y\)-axis.) [§6.1]

\quad \texttt{\textbackslash refname}

\textbf{Defined in:} Article style classes that define a bibliography section.

Text used for bibliography section heading. (See also \texttt{\textbackslash bibname}.) [§8.2]

\quad \texttt{\textbackslash refstepcounter\{(counter)\}}

\textbf{Defined in:} \LaTeX{} Kernel.

Increments the value of the given counter by one and allows the counter to be cross-referenced using \texttt{\textbackslash ref} and \texttt{\textbackslash label}. [§11.0]

\quad \texttt{\textbackslash renewcommand\{(cmd)\}\{(n-args)\}\{(default)\}\{\textbackslash text\}}

\textbf{Defined in:} \LaTeX{} Kernel.

Redefines an existing command. [§8.2]
\renewenvironment{⟨env-name⟩}{{⟨n-args⟩}}{{⟨default⟩}}{{⟨begin-code⟩}}{{⟨end-code⟩}

**Defined in:** \LaTeX{} Kernel.
Redefines an existing environment. [§10.1]

\resizebox{⟨h length⟩}{⟨v length⟩}{{⟨text⟩}

**Defined in:** graphicx package.
Scales the specified contents to the given dimensions. [§6.1]

\rfloor

**Defined in:** \LaTeX{} Kernel (Math Mode).
Right floor \delimiter. [§9.4]

\rho

**Defined in:** \LaTeX{} Kernel (Math Mode).
Greek lower case rho \(\rho\). [§9.4]

\right⟨delimiter⟩

**Defined in:** \LaTeX{} Kernel (Math Mode).
Indicates a right stretchable delimiter. Must have a matching \left. [§9.4]

\Rightarrow

**Defined in:** \LaTeX{} Kernel (Math Mode).
Double-lined right arrow \(\Rightarrow\). [§9.4]

\rightarrow

**Defined in:** \LaTeX{} Kernel (Math Mode).
Right arrow \(\to\). [§9.4]

\rightharpoondown

**Defined in:** \LaTeX{} Kernel (Math Mode).
Right down harpoon \(\rightharpoondown\). [§9.4]

\rightharpoonup

**Defined in:** \LaTeX{} Kernel (Math Mode).
Right up harpoon \(\rightharpoonup\). [§9.4]

\rightleftharpoons

**Defined in:** \LaTeX{} Kernel (Math Mode).
Right-left harpoons \(\rightleftharpoons\). [§9.4]

\rmdefault

**Defined in:** \LaTeX{} Kernel.
The name of the default serif family as used by \rmfamily.
Defaults to cmr (Computer Modern Roman). [§8.2]

\rmfamily

**Defined in:** \LaTeX{} Kernel.
Switches to the predefined serif font. (Defaults to Computer Modern Roman.) [§4.5]

\Roman{⟨counter⟩}

**Defined in:** \LaTeX{} Kernel.
Displays counter value as an upper case Roman number. (I, II, III, \ldots) [§11.0]

\roman{⟨counter⟩}

**Defined in:** \LaTeX{} Kernel.
Displays counter value as a lower case Roman number. (i, ii, iii, \ldots) [§11.0]
\rotatebox\{(option list)\}\{(angle)\}\{(text)\}

**Defined in:** graphicx package.

Rotates the given contents by the given angle. [§6.1]

\rVert

**Defined in:** amsmath (Math Mode).

Right double vertical bar \| delimiter. [§9.4]

\rvert

**Defined in:** amsmath (Math Mode).

Right vertical bar | delimiter. [§9.4]

\S

**Defined in:** \LaTeX\ Kernel.

Sectional § symbol. [§4.3]

\sb\{\(maths)\}

**Defined in:** \LaTeX\ Kernel (Math Mode).

Displays its argument as a subscript. [§9.4]

\scalebox\{(h scale)\}\{(v scale)\}\{(text)\}

**Defined in:** graphicx package.

Scales the specified contents. [§6.1]

\scriptsize

**Defined in:** Most document classes.

Switches to sub- or superscript sized text. [§4.5]

\scshape

**Defined in:** \LaTeX\ Kernel.

Sets the value of a counter. [§11.0]

\setlength\{(register)\}\{(dimension)\}

**Defined in:** \LaTeX\ Kernel.

Sets the value of a length register. [§2.17]
\setminus

**Defined in:** \LaTeX{} Kernel (Math Mode).

Operator \ symbol. [§9.4]

\sfdefault

**Defined in:** \LaTeX{} Kernel.

The name of the default sans-serif family as used by \sffamily.
Defaults to cms (Computer Modern Sans-serif). [§8.2]

\sffamily

**Defined in:** \LaTeX{} Kernel.

Switches to the predefined sans-serif font. (Defaults to Computer Modern Sans.) [§4.5]

\shadowbox{\{text\}}

**Defined in:** fancybox package.

Puts a shadow frame around its contents, prohibiting a line break in the contents. [§4.7]

\begin{sidewaysfigure}

**Defined in:** rotating package.

Like the \texttt{figure} environment but rotates the entire figure (including caption) sideways. [§7.3]

\begin{sidewaystable}

**Defined in:** rotating package.

Like the \texttt{table} environment but rotates the entire table (including caption) sideways. [§7.3]

\Sigma

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek upper case sigma \( \Sigma \). [§9.4]

\sigma

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case sigma \( \sigma \). [§9.4]

\sim

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \( \sim \) symbol. [§9.4]

\simeq

**Defined in:** \LaTeX{} Kernel (Math Mode).

Relational \( \simeq \) symbol. [§9.4]

\sin

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets sin function name. [§9.4]

\sinh

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets sinh function name. [§9.4]

\slash

**Defined in:** \LaTeX{} Kernel.

Forward slash / symbol. [§4.3]

\slshape

**Defined in:** \LaTeX{} Kernel.

Switches to the slanted form of the current font family, if it exists. [§4.5]

Symbols

\begin{center}

\begin{tabular}{ccccccccccc}
\end{tabular}
\end{center}
\texttt{\textbackslash small}  
**Defined in:** Most document classes.  
Switches to small sized text. [§4.5]

\texttt{\textbackslash begin\{smallmatrix\}}  
**Defined in:** amsmath package (Math Mode).  
Like the \texttt{array} environment but doesn't have an argument and is designed for in-line maths. [§9.4]

\texttt{\textbackslash smile}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Relational $\sim$ symbol. [§9.4]

\texttt{\textbackslash sp\{\texttt{\{maths\}}\}}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Displays its argument as a superscript. [§9.4]

\texttt{\textbackslash sqcap}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Operator $\sqcap$ symbol. [§9.4]

\texttt{\textbackslash sqcup}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Operator $\sqcup$ symbol. [§9.4]

\texttt{\textbackslash sqrt\{\texttt{\{order\}\{\{operand\}\}\}}\}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Displays a root. [§9.4]

\texttt{\textbackslash sqsubset\textbackslash eq\}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Relational $\sqsubset\textbackslash eq$ symbol. [§9.4]

\texttt{\textbackslash sqsupset\textbackslash eq}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Relational $\sqsupset\textbackslash eq$ symbol. [§9.4]

\texttt{\textbackslash SS}  
**Defined in:** \LaTeX{} Kernel.  
SS (upper case ß). [§4.3]

\texttt{\textbackslash ss}  
**Defined in:** \LaTeX{} Kernel.  
Eszett ß character. [§4.3]

\texttt{\textbackslash star}  
**Defined in:** \LaTeX{} Kernel (Math Mode).  
Operator $\star$ symbol. [§9.4]

\texttt{\textbackslash stepcounter\{\texttt{\{counter\}\}\}}\}  
**Defined in:** \LaTeX{} Kernel.  
Increments the value of the given counter by one. [§11.0]

\texttt{\textbackslash begin\{subfigure\}\{\texttt{\{pos\}\{\{width\}\}\}\}  
**Defined in:** subcaption package.  
Used to form a subfigure within a \texttt{figure} environment. The \texttt{\caption} command may be used in this environment to produce a subcaption. [§7.4]

**Symbols**  
\begin{tabular}{|l|}
\hline
A \\
B \\
C \\
D \\
E \\
F \\
G \\
H \\
I \\
J \\
K \\
L \\

\end{tabular}
\subject{⟨text⟩}

**Defined in:** scrartcl, scrreprt, scrbook classes.

Specifies the subject (typeset just above the title). [§5.1]

\subparagraph[⟨short title⟩]{⟨title⟩}

**Defined in:** Most classes that have the concept of document structure.

Inserts a subsubsubsection header. Most classes default to an unnumbered running header for this sectional unit. **This command has a moving argument.** [§5.3]

\subref{⟨label⟩}

**Defined in:** subcaption package.

Analogous to \ref but only references the subfigure or subtable caption. [§7.4]

\subsection[⟨short title⟩]{⟨title⟩}

**Defined in:** Most classes that have the concept of document structure.

Inserts a subsection header. **This command has a moving argument.** [§5.3]

\substack{⟨maths⟩}

**Defined in:** amsmath package.

Can be used to produce a multiline subscript or superscript. Lines are separated using \. [§9.4]

\subsubsection[⟨short title⟩]{⟨title⟩}

**Defined in:** Most classes that have the concept of document structure.

Inserts a subsubsection header. **This command has a moving argument.** [§5.3]

\begin{subtable}{⟨width⟩}

**Defined in:** subcaption package.

Used to form a subtable within a table environment. The \caption command may be used in this environment to produce a subcaption. [§7.4]

\subtitle{⟨text⟩}

**Defined in:** scrartcl, scrreprt, scrbook classes.

Specifies the subtitle (typeset just below the title). [§5.1]

\subset

**Defined in:** \LaTeX Kernel (Math Mode).

Subset $\subset$ symbol. [§9.4]

\subsetneq

**Defined in:** \LaTeX Kernel (Math Mode).

Relational $\subseteq$ symbol. [§9.4]

\succ

**Defined in:** \LaTeX Kernel (Math Mode).

Relational $\succ$ symbol. [§9.4]

\succeq

**Defined in:** \LaTeX Kernel (Math Mode).

Relational $\succeq$ symbol. [§9.4]
\sum
Defined in: \LaTeX{} Kernel (Math Mode).
Summation $\sum$ symbol (may take limits). [§9.4]

\sup
Defined in: \LaTeX{} Kernel (Math Mode).
Typesets sup function name (may have limits via \_ or \^). [§9.4]

\supset
Defined in: \LaTeX{} Kernel (Math Mode).
Relational $\supset$ symbol. [§9.4]

\supseteq
Defined in: \LaTeX{} Kernel (Math Mode).
Relational $\supseteq$ symbol. [§9.4]

\swarrow
Defined in: \LaTeX{} Kernel (Math Mode).
South-West arrow $\swarrow$. [§9.4]

T
\texttt{\{characters\}}
Defined in: \LaTeX{} Kernel.
Tie over \texttt{\{characters\}}. Example: \texttt{T\{xy\}} produces $xy$. [§4.3]

\tabcolsep
Defined in: \LaTeX{} Kernel.
Length register specifying half the gap between columns in a \texttt{tabular} environment. [§4.6]

\begin{table}[(placement)]
\caption{...
Table caption. [§7.2]

\tablename
Defined in: Classes or packages that define tables.
Number prefix used in table captions. [§8.2]

\tableofcontents
Defined in: Most classes that have the concept of document structure.
Inserts the table of contents. A second (possibly third) run is required to ensure the page numbering is correct. [§5.4]

\begin{tabular}{\langle v-pos \rangle}
\langle column specifiers \rangle
\end{tabular}
Defined in: \LaTeX{} Kernel (Text Mode).
Environment for lining things up in rows and columns. Use \texttt{array} for math mode. [§4.6]

\tabularnewline
Defined in: \LaTeX{} Kernel.
Behaves like \texttt{\\} in a \texttt{tabular}-like environment but helps to disambiguate a line break in a paragraph cell from a row separator. [§4.6]
\textbf{\texttt{\textbackslash{tag}}}

**Defined in:** amsmath package.

Overrides equation numbering for the current row in environments such as `align`. [§9.3]

\textbf{\texttt{\textbackslash{tan}}}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets tan function name. [§9.4]

\textbf{\texttt{\textbackslash{tanh}}}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Typesets tanh function name. [§9.4]

\textbf{\texttt{\textbackslash{tau}}}

**Defined in:** \LaTeX{} Kernel (Math Mode).

Greek lower case tau \(\tau\). [§9.4]

\textbf{\texttt{\textbackslash{TeX}}}

**Defined in:** \LaTeX{} Kernel.

Typesets the \TeX{} logo. [§2.6]

\textbf{\texttt{\textbackslash{text}}} \{\text{⟨text⟩}\}

**Defined in:** amsmath package (Math Mode).

Displays its argument in the normal text font (as opposed to the current maths font). [§9.2]

\textbf{\texttt{\textbackslash{texasciicircum}}}

**Defined in:** \LaTeX{} Kernel.

Circumflex ^ symbol. [§4.3]

\textbf{\texttt{\textbackslash{texascii\textbackslash{tilde}}}}

**Defined in:** \LaTeX{} Kernel.

Tilde ~ symbol. (If you are typing an URL, use the url package, which provides \texttt{\textbackslash{url}}} \{⟨address⟩\} that allows you to directly type ~ in the address.) [§4.3]

\textbf{\texttt{\textbackslash{textbackslash{slash}}}}

**Defined in:** \LaTeX{} Kernel (Text Mode).

Backslash \ symbol. (Use \texttt{\textbackslash{backslash}} for math mode.) [§4.3]

\textbf{\texttt{\textbackslash{textbar}}}

**Defined in:** \LaTeX{} Kernel.

Vertical bar | symbol. [§4.3]

\textbf{\texttt{\textbackslash{textbf}}} \{⟨text⟩\}

**Defined in:** \LaTeX{} Kernel.

Renders ⟨text⟩ with a bold weight in the current font family, if it exists. [§4.5]

\textbf{\texttt{\textbackslash{textbullet}}}

**Defined in:** \LaTeX{} Kernel (Text Mode).

Bullet • symbol. [§4.3]

\textbf{\texttt{\textbackslash{textcolor}}} \{⟨model⟩\} \{⟨specs⟩\} \{⟨text⟩\}

**Defined in:** color and xcolor packages.

Sets ⟨text⟩ with the foreground colour according to the given ⟨specs⟩. [§8.0]

\textbf{\texttt{\textbackslash{textemdash}}}

**Defined in:** \LaTeX{} Kernel.

Em-dash — symbol. (Normally used to indicate omissions or interruptions or to highlight a
parenthetical element.) See also \textendash. \([4.3]\]

\textendash

**Defined in:** \LaTeX{} Kernel.

En-dash – symbol. (Normally used for number ranges.) See also \textendash. \([4.3]\]

\textendash

**Defined in:** \LaTeX{} Kernel.

Defined in: \LaTeX{} Kernel.

Renders \langle text \rangle with the italic form of the current font family, if it exists. \([4.5]\]

\textit{⟨text⟩}

**Defined in:** \LaTeX{} Kernel.

Renders \langle text \rangle with a medium weight in the current font family. \([4.5]\]

\textmd{⟨text⟩}

**Defined in:** \LaTeX{} Kernel.

Renders \langle text \rangle in the default font style. \([4.5]\]

\textnormal{⟨text⟩}

**Defined in:** \LaTeX{} Kernel.

Renders \langle text \rangle in the default font style. \([4.5]\]

\textperiodcentered

Defined in: \LaTeX{} Kernel (Text Mode).

Centred period · symbol. \([4.3]\]

\textquestiondown

**Defined in:** \LaTeX{} Kernel.

Upside-down question mark ¿ symbol. \([4.3]\]

\textquotedblleft

**Defined in:** \LaTeX{} Kernel.

Opening double quote “ symbol. \([4.3]\]

\textquotedblright

**Defined in:** \LaTeX{} Kernel.

Closing double quote “ symbol. \([4.3]\]

\textquoteleft

**Defined in:** \LaTeX{} Kernel.

Opening single quote ‘ symbol. \([4.3]\]

\textquoteright

**Defined in:** \LaTeX{} Kernel.

Opening single quote ‘ symbol. \([4.3]\]
\textquoteleft
\textbf{Defined in:} \LaTeX{} Kernel.
Closing single quote (or apostrophe) ' symbol. \([4.3]\)

\textregistered
\textbf{Defined in:} \LaTeX{} Kernel.
Registered ® symbol. \([4.3]\)

\texttt{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle in the predefined monospaced font. (Defaults to Computer Modern Typewriter.) \([4.5]\)

\textunderscore
\textbf{Defined in:} \LaTeX{} Kernel.
Underscore _ symbol (see also \texttt{\textunderscore}). \([4.3]\)

\textwidth
\textbf{Defined in:} \LaTeX{} Kernel.
A length containing the width of the typeblock. Note that the actual contents of the line may fall short of the line width (underfull hbox) or extend beyond it (overfull hbox). This width does not include the area for marginal notes. \([2.17]\)

\thanks{(text)}
\textbf{Defined in:} Most classes that have the concept of a title page.
Inserts a special type of footnote in one of the titling fields, such as \texttt{\author} or \texttt{\title}. Usually used for some form of acknowledgement or affiliation. \([5.1]\)

\textsc{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle with the small-caps form of the current font family, if it exists. \([4.5]\)

\textsf{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle in the predefined sans-serif font. (Defaults to Computer Modern Sans.) \([4.5]\)

\textsl{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle with the slanted form of the current font family, if it exists. \([4.5]\)

\texttt{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle in the predefined serif font. (Defaults to Computer Modern Roman.) \([4.5]\)

\textsc{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle with the small-caps form of the current font family, if it exists. \([4.5]\)

\textsf{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle in the predefined sans-serif font. (Defaults to Computer Modern Sans.) \([4.5]\)

\textsl{(text)}
\textbf{Defined in:} \LaTeX{} Kernel.
Renders \langle text \rangle with the slanted form of the current font family, if it exists. \([4.5]\)

\texttrademark
\textbf{Defined in:} \LaTeX{} Kernel.
Trademark ™ symbol. \([4.3]\)

\thanks{(text)}
\textbf{Defined in:} Most classes that have the concept of a title page.
Inserts a special type of footnote in one of the titling fields, such as \texttt{\author} or \texttt{\title}. Usually used for some form of acknowledgement or affiliation. \([5.1]\)

\the(register)
\textbf{Defined in:} \LaTeX{} Kernel.
Displays the value of the given register (such as a length register).
Not to be confused with \texttt{\thectr} commands, such as \texttt{\thefigure}.
[§2.17]

\begin{thebibliography}{⟨widest entry label⟩}
\end{thebibliography}
\textbf{Defined in:} Most classes that define sectioning commands.
Bibliographic list. (See also \texttt{\bibitem} and \texttt{\cite}). [§5.6]

\thecounter{chapter}
\textbf{Defined in:} \LaTeX{} Kernel.
Displays the current value of the chapter counter [§11.0]

\thecounter{figure}
\textbf{Defined in:} \LaTeX{} Kernel.
Displays the current value of the figure counter [§11.0]

\thecounter{footnote}
\textbf{Defined in:} \LaTeX{} Kernel.
Displays the current value of the footnote counter [§11.0]

\thecounter{page}
\textbf{Defined in:} \LaTeX{} Kernel.
Displays the current value of the page counter [§11.0]

\thecounter{section}
\textbf{Defined in:} \LaTeX{} Kernel.
Displays the current value of the section counter [§11.0]

\texttt{\Theta}
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Greek upper case theta $\Theta$. [§9.4]

\texttt{\theta}
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Greek lower case theta $\theta$. [§9.4]

\texttt{\thinspace}
\textbf{Defined in:} \LaTeX{} Kernel.
Thin space. [§9.4]

\texttt{\times}
\textbf{Defined in:} \LaTeX{} Kernel (Math Mode).
Operator $\times$ symbol. [§9.4]

\texttt{\tiny}
\textbf{Defined in:} Most document classes.
Switches to tiny sized text. [§4.5]

\texttt{\text{(text)}}
\textbf{Defined in:} Most classes that have the concept of a title page.
Specifies the document title. This command doesn't display any text
so may be used in the preamble, but if it's not in the preamble it must be placed before \maketitle. \[§5.1\]

\titlehead{⟨text⟩}

**Defined in:** scrartcl, scrlrept, scrbook classes.

Specifies the title header (typeset at the top of the title page). \[§5.1\]

\to

**Defined in:** \LaTeX{} Kernel (Math Mode).

Right arrow \(→\). \[§9.4\]

\today

**Defined in:** Most of the commonly-used classes.

Inserts into the output file the date when the \LaTeX{} application created it from the source code. \[§4.1\]

\toprule[⟨wd⟩]

**Defined in:** booktabs package.

Horizontal rule for the top of a \texttt{tabular} environment. \[§4.6\]

\triangledleft

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator \(\triangleleft\) symbol. \[§9.4\]

\triangleright

**Defined in:** \LaTeX{} Kernel (Math Mode).

Binary operator \(\triangleright\) symbol. \[§9.4\]

\ttdefault

**Defined in:** \LaTeX{} Kernel.

The name of the default typewriter family as used by \ttfamily.

Defaults to \texttt{cmtt} (Computer Modern Typewriter). \[§8.2\]

\ttfamily

**Defined in:** \LaTeX{} Kernel.

Switches to the predefined monospaced font. (Defaults to Computer Modern Typewriter.) \[§4.5\]

\today

**Defined in:** Most of the commonly-used classes.

Inserts into the output file the date when the \LaTeX{} application created it from the source code. \[§4.1\]

\texttt{U}

\u{⟨c⟩}

**Defined in:** \LaTeX{} Kernel.

Breve diacritic over \(⟨c⟩\). Example: \texttt{u{o}} produces ˘ \(o\). \[§4.3\]

\underleftarrow{⟨maths⟩}

**Defined in:** amsmath package (Math Mode).

Puts an extendible left arrow under \(⟨maths⟩\) \[§9.4\]

\underleftrightarrow{⟨maths⟩}

**Defined in:** amsmath package (Math Mode).

Puts an extendible left-right arrow under \(⟨maths⟩\) \[§9.4\]

\underrightarrow{⟨maths⟩}

**Defined in:** amsmath package (Math Mode).

Puts an extendible right arrow under \(⟨maths⟩\) \[§9.4\]

\Uparrow

**Defined in:** \LaTeX{} Kernel (Math Mode).
Double-lined up arrow ⇑. (May be used as a delimiter.) \[\S9.4\]

\uparrow

**Defined in:** \LaTeX\ Kernel (Math Mode).

Up arrow ↑. (May be used as a delimiter.) \[\S9.4\]

\Updownarrow

**Defined in:** \LaTeX\ Kernel (Math Mode).

Double-ended double-lined vertical arrow ⇓. (May be used as a delimiter.) \[\S9.4\]

\updownarrow

**Defined in:** \LaTeX\ Kernel (Math Mode).

Double-ended vertical arrow ↕. (May be used as a delimiter.) \[\S9.4\]

\uplus

**Defined in:** \LaTeX\ Kernel (Math Mode).

Operator $\cup$ symbol. \[\S9.4\]

\upshape

**Defined in:** \LaTeX\ Kernel.

Switches to the upright form of the current font family. \[\S4.5\]

\Upsilon

**Defined in:** \LaTeX\ Kernel (Math Mode).

Greek upper case upsilon $\Upsilon$. \[\S9.4\]

\upsilon

**Defined in:** \LaTeX\ Kernel (Math Mode).

Greek lower case upsilon $\upsilon$. \[\S9.4\]

\url{⟨address⟩}

**Defined in:** url package.

Typesets an URL in a typewriter font and allows you to use characters such as ~. \[\S4.5\]

\usepackage[⟨option-list⟩]{⟨package-list⟩}

**Defined in:** \LaTeX\ Kernel.

Loads the named packages. \[\S4.2\]

\v{⟨c⟩}

**Defined in:** \LaTeX\ Kernel.

Caron diacritic over ⟨c⟩. Example: $\v{o}$ produces $\check{o}$. \[\S4.3\]

\value{⟨counter⟩}

**Defined in:** \LaTeX\ Kernel.

References the value of the given counter where a number rather than a counter name is required. \[\S11.0\]

\varvarepsilon

**Defined in:** \LaTeX\ Kernel (Math Mode).

Variant Greek lower case alpha $\varepsilon$. \[\S9.4\]

\varliminf

**Defined in:** amsmath (Math Mode).

Typesets $\lim_{\rightarrow}$ function name (may have limits via \_= or ^). \[\S9.4\]

\varinjlim

**Defined in:** amsmath (Math Mode).
Typesets \( \lim \) function name (may have limits via \( _n \) or \( ^n \)). [§9.4]

\texttt{\textbackslash varlimsup}

**Defined in:** amsmath (Math Mode).
Typesets \( \varlimsup \) function name (may have limits via \( _n \) or \( ^n \)). [§9.4]

\texttt{\textbackslash varphi}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Variant Greek lower case phi \( \varphi \). [§9.4]

\texttt{\textbackslash varpi}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Variant Greek lower case pi \( \varpi \). [§9.4]

\texttt{\textbackslash varprojlim}

**Defined in:** amsmath (Math Mode).
Typesets \( \varprojlim \) function name (may have limits via \( _n \) or \( ^n \)). [§9.4]

\texttt{\textbackslash varrho}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Variant Greek lower case rho \( \varrho \). [§9.4]

\texttt{\textbackslash varsigma}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Variant Greek lower case sigma \( \varsigma \). [§9.4]

\texttt{\textbackslash vartheta}

**Defined in:** \LaTeX{} Kernel (Math Mode).
A variant Greek lower case theta \( \vartheta \). [§9.4]

\texttt{\textbackslash vdash}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Relational \( \vdash \) symbol. [§9.4]

\texttt{\textbackslash vdots}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Vertical ellipses : symbol. [§9.4]

\texttt{\textbackslash vec\{c\}}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Typesets its argument as a vector (defaults to a right arrow accent). [§9.4]

\texttt{\textbackslash vee}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Operator \( \lor \) symbol. [§9.4]

\texttt{\textbackslash begin\{Vmatrix\}}

**Defined in:** amsmath package (Math Mode).
Like the \texttt{array} environment, but doesn't have an argument and adds double vertical bar delimiters. [§9.4]

\texttt{\textbackslash begin\{vmatrix\}}

**Defined in:** amsmath package (Math Mode).
Like the \texttt{array} environment, but doesn't have an argument and adds single vertical bar delimiters. [§9.4]
\texttt{\vref{\{string\}}}

**Defined in:** `varioref` package.
Like \texttt{\ref} but also adds information about the location, such as “on page \texttt{\langle n\rangle}” or “on the following page”. [§5.5]

\texttt{\vspace{\{length\}}}

**Defined in:** \LaTeX{} Kernel.
Inserts a vertical gap of the given height. [§11.0]

\texttt{\wedge}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Operator \texttt{\wedge} symbol. [§9.4]

\texttt{\wr}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Operator \texttt{\wr} symbol. [§9.4]

\texttt{\Xi}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Greek upper case xi \texttt{\Xi}. [§9.4]

\texttt{\xi}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Greek lower case xi \texttt{\xi}. [§9.4]

\texttt{\xleftarrow{\{\langle subscript\rangle\} \{\langle superscript\rangle\}}}

**Defined in:** `amsmath` package (Math Mode).
An extendible left arrow with a superscript and optionally a subscript. [§9.4]

\texttt{\xrightarrow{\{\langle subscript\rangle\} \{\langle superscript\rangle\}}}

**Defined in:** `amsmath` package (Math Mode).
An extendible right arrow with a superscript and optionally a subscript. [§9.4]

\texttt{\zeta}

**Defined in:** \LaTeX{} Kernel (Math Mode).
Greek lower case zeta \texttt{\zeta}. [§9.4]
INDEX

Page numbers in *italic* indicate the primary reference. Page numbers in **bold** indicate the entry definition in the summary.

GNU Free Documentation License

Version 1.2, November 2002

51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.
A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, TeXinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.
A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History"). To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public
has access to download using public-standard network protocols a complete
Transparent copy of the Document, free of added material. If you use
the latter option, you must take reasonably prudent steps, when you begin
distribution of Opaque copies in quantity, to ensure that this Transparent
copy will remain thus accessible at the stated location until at least one year
after the last time you distribute an Opaque copy (directly or through your
agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the
Document well before redistributing any large number of copies, to give
them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under
the conditions of sections 2 and 3 above, provided that you release the Mod-
ified Version under precisely this License, with the Modified Version filling
the role of the Document, thus licensing distribution and modification of the
Modified Version to whoever possesses a copy of it. In addition, you must
do these things in the Modified Version:

A. Use in the Title Page (and on the covers, if any) a title distinct from that
of the Document, and from those of previous versions (which should, if
there were any, be listed in the History section of the Document). You
may use the same title as a previous version if the original publisher
of that version gives permission.

B. List on the Title Page, as authors, one or more persons or entities
responsible for authorship of the modifications in the Modified Version,
together with at least five of the principal authors of the Document (all
of its principal authors, if it has fewer than five), unless they release
you from this requirement.

C. State on the Title page the name of the publisher of the Modified Ver-
sion, as the publisher.

D. Preserve all the copyright notices of the Document.

E. Add an appropriate copyright notice for your modifications adjacent to
the other copyright notices.

F. Include, immediately after the copyright notices, a license notice giving
the public permission to use the Modified Version under the terms of
this License, in the form shown in the Addendum below.

G. Preserve in that license notice the full lists of Invariant Sections and
required Cover Texts given in the Document's license notice.

H. Include an unaltered copy of this License.
I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.

N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.

O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you
may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is
included in an aggregate, this License does not apply to the other works in
the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies
of the Document, then if the Document is less than one half of the en-
tire aggregate, the Document's Cover Texts may be placed on covers that
bracket the Document within the aggregate, or the electronic equivalent of
covers if the Document is in electronic form. Otherwise they must appear
on printed covers that bracket the whole aggregate.

8. TRANSLATION

Translation is considered a kind of modification, so you may distribute
translations of the Document under the terms of section 4. Replacing In-
variant Sections with translations requires special permission from their
copyright holders, but you may include translations of some or all Invariant
Sections in addition to the original versions of these Invariant Sections. You
may include a translation of this License, and all the license notices in the
Document, and any Warranty Disclaimers, provided that you also include
the original English version of this License and the original versions of
those notices and disclaimers. In case of a disagreement between the trans-
lation and the original version of this License or a notice or disclaimer, the
original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedica-
tions", or "History", the requirement (section 4) to Preserve its Title (sec-
tion 1) will typically require changing the actual title.

9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except
as expressly provided for under this License. Any other attempt to copy,
modify, sublicense or distribute the Document is void, and will automati-
cally terminate your rights under this License. However, parties who have
received copies, or rights, from you under this License will not have their
licenses terminated so long as such parties remain in full compliance.

10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the
GNU Free Documentation License from time to time. Such new versions
will be similar in spirit to the present version, but may differ in detail to
address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If
the Document specifies that a particular numbered version of this License
"or any later version" applies to it, you have the option of following the
terms and conditions either of that specified version or of any later version
that has been published (not as a draft) by the Free Software Foundation. If
the Document does not specify a version number of this License, you may
choose any version ever published (not as a draft) by the Free Software
Foundation.
ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright © YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled “GNU Free Documentation License”.

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the “with … Texts.” line with this:

with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
History

25th Sept 2012 (Version 1.4)

• Paperback edition 1 produced.
• Added TeXWorks section.
• Moved "Text editor and Terminal approach", "TeXnicCenter" and "WinEdt" sections to new supplementary material.
• Added hardcopy-related code.
• Change to KOMA-Script classes (both for examples and for pdf versions of this document).
• Changed from using subfloat to subcaption package.
• Added section on inter-sentence spacing.
• Moved "Errors" and "Where to get Help?" to appendices.
• Moved section "Downloading and Installing Packages" to new appendix chapter.
• Moved introduction to packages to "Creating a Simple Document".
• Moved datetime section to "Creating a Simple Document" chapter. (Removed reference to ukdate package.)
• Moved babel section to "Structuring Your Document" chapter.
• Moved graphicx section to its own chapter.
• Added section on align.
• Added $\frac{}{}$, $\substack{}$ and amsmath ellipses to maths chapter.
• Added extensible arrows and $\bigl$ etc to maths chapter.
• Added booktabs.
• Moved lengths chapter to section in definitions.
• Added summary chapter with commands hyperlinked to their definitions in the summary.
• Changed definitions chapter to use a glossary structure.
• Moved bibliography into bib file.
• Added varioref.
• Removed dependency on html package (for pdf versions) to avoid conflict between html and varioref (html package functions not defined by hyperref now emulated; comment package loaded to provide htmlonly environment).
• Removed image of equation written in Word (Microsoft have improved their equation rendering) and added link to Murray Sargent III blog [12].
• Added section on what a terminal/command prompt is.
• Added section on auxiliary files.
• Added section on Perl.
• Added information about latexmk
• Mentioned grffile package.
• Mentioned on-the-fly EPS conversion.
• Mentioned etoolbox\textquoteleft s \texttt{\textbackslash addto} and babel\textquoteleft s \texttt{\textbackslash addto}.
• Changed to UTF-8 and mostly changed to using code points instead of named entities in HTML files.
• Moved the document's home page from \url{http://theoval.cmp.uea.ac.uk/~nlct/latex/novices/} to \url{http://www.dickimaw-books.com/latex/novices/}.

15th Jan 2008 (Version 1.3)

The main reason behind this change was to increase accessibility and conform to W3C guidelines. If you are experiencing problems relating to accessibility, please let me know (clearly stating the problem).

• Corrected error in the university's post code on the title page
• Added alternative text tags to more of the images, and made some of the images hyperlinks to a more detailed description of the image.
• Added information on how to break ligatures.
• Moved information on TeX to the introduction, and removed section on TeX that was in the "Some Definitions" chapter.
• Document nodes now have permanent names instead of the generic node\texttt{(n)}.html which \texttt{\LaTeX2HTML} generates by default.
• Went back to using straight double quotes in the HTML document as the fancy typographic double quotes are nonstandard.
8th May 2007 (Version 1.2)

- Links to UK FAQ [18] added.
- Overview made into a separate section, and tidied up a bit.
- Added some extra definitions: moving arguments and fragile commands, robust commands, short and long commands.
- Changed “Text editor and Terminal approach” to deal with Unix-type systems rather than MS-DOS.
- Moved section on tabular environment.
- Added section on boxes and mini-pages.
- Segmented section on font changing commands.
- Segmented section describing graphicx.
- Added section on the babel package.
- Updated and segmented section on downloading and installing new packages.
- Added section on side-by-side figures.
- Updated section on sub-figures to use the new subfloat package instead of the obsolete subfigure package.
- Added “Need More Help?” chapter.
(See http://www.gnu.org/licenses/fdl-howto-opt.html#SEC2.)

If you choose to buy a copy of this book, Dickimaw Books asks for your support through buying the Dickimaw Books edition to help cover costs.
